This book is particularly concerned with China's path to green development and how it can be understood, exploring questions such as how the goal of Chinese-led green development can be achieved. The book provides systematic explanations of the theory of green development, exploring its background, its theoretical basis, the areas it covers, the stages it encompasses and the constraining and favorable factors involved. We see how humankind is at a period of transition from the traditional black industrial civilization to a modern green ecological civilization. The author gives a profound critique of the traditional Western model of development, provides a comprehensive analysis of the crisis and the opportunities presented by green development and depicts the grand goal of green modernization in a creative, bold, forward-looking manner. A three-step strategy to design and promote green development is proposed. Readers will discover why China must become an innovator, practitioner, and leader of green development, and how green planning is an important means to establish green development. The book explores how local governments can become green innovation practitioners, and how enterprises can become the main arena of green development. This book is a creative and innovative work that will appeal to scholars interested in the long-term development of humankind in general and China in particular. It also serves well as a green development textbook, presenting related scientific knowledge and important information for decision-making in a concise, easy-to-understand form. Summary: There is now a race among nations to develop and export clean energy solutions, and a

race to find ways to reduce our impact on the environment. Ben McNeil argues Australians must join this race and shows us how we can make the most of our natural advantages, for the sake our future economic prosperity. First Published in 1999. Routledge is an imprint of Taylor & Francis, an informa company. Business Marketing is an academic textbook written from a marketing management perspective. It is about the marketing methods, issues and principles associated with the relationships and interactions between organisations. The world economy today is at an historical inflection point. The neoclassical (industrial) model of economics is self-destructing while a new life-mimicking model, based on radically different assumptions, is emerging. Although rarely acknowledged in economic journals, Nordic countries, which pioneered the life-mimicking model, have become world leaders in prosperity and productivity while those operating on the older neoclassical/industrial model are trapped in downward spirals. By approaching economies as sub-systems of life rather than super-systems that transcend life, we gain transformative insights. Such thinking led to the first circular economy experiments in Kalundborg (Denmark) during the 1970s, then quickly spread to the rest of the Nordic world. By placing a higher value on living assets (people and Nature) than on non-living capital assets, this approach generates harmony rather than exploitation and conflict. Because Nordic people feel vested in the system and responsible for its success, they are extraordinarily innovative and productive. That is why Nordic companies are regularly rated among the world's most sustainable and profitable in their fields – even though their region holds less than half of one percent of the world's population. Written in an accessible way for non-economists, the book is ideal for readers interested in the benefits of biomimicry and methods of guiding democratic

countries along a proven path of self-renewal. Economies That Mimic Life will also provide useful background for corporate leaders in scenario planning and strategic thinking. Knowing which way the political-economic wind is blowing will become increasingly important to corporate survival. With Profiting from Clean Energy, respected investment analyst Richard Asplund provides an in-depth explanation of the technology and industry structure behind various sectors of this field and in the process identifies more than 150 stocks related to clean energy. Along the way, Asplund discusses exactly what it takes to effectively invest in clean energy—whether it be through buying individual stocks, investing in green exchange-traded funds or mutual funds, or trading the biofuel and carbon credit markets. Also has: Minutes of proceedings of annual general meeting, 1910. China, the European Union and Global Governance examines the key determinants of European and Chinese approaches to the restructuring of global governance systems. Using a multidisciplinary method, this collection of chapters analyses four distinct fields that are key for both China and the EU and in the development of their relations and future cooperation: the global trading system, the international monetary system, climate and energy policy and international security. In the context of China's growing role in global governance and of EU-China cooperation, these contributions emphasize strategies, prospects and objectives of both actors. They outline possible avenues for an enhanced partnership in light of the changing global order, which implies a rethinking of the existing multilateral structures. This interdisciplinary study will appeal to researchers and scholars interested in global governance, European foreign policy, Chinese foreign policy, EU-China relations, as well as trade, the international economy and climate change policies. Postgraduate students

in international relations, international political economy, European studies and Chinese studies, as well as policymakers in the areas of external relations and EU-China relations, will also find much to interest them in this book. The sixth edition of the series highlights employment trends in renewables worldwide, noting increasing diversification of the supply chain. Active investing strategies to profit from world-changing trends

In *The Next Great Bull Market*, Matthew McCall advocates an approach he calls, "Conversification," meaning concentrating your investments in specific areas that are poised to benefit from global change. The areas of change addressed throughout this book include the green movement, infrastructure expansion, commodities, peak oil, the next great commodity-water-aging baby boomers, a growing global middle class, geopolitical upheavals, and the explosion of exchange-traded funds. With today's world characterized by rapid change on many different levels, McCall's approach holds even greater promise in the years ahead. Page by page, he provides strategies for both conservative investors interested in long-term growth and aggressive investors interested in generating fast profits. Describes the dynamics driving each major change and provide specific strategies to take advantage of them Shows how to profit from short-term swings in fast-moving sectors of the world economy Highlights how to use various investment vehicles, including ETFs, stocks, and options Investors who understand and anticipate the changes ahead stand to profit handsomely. With *The Next Great Bull Market* as your guide, you'll quickly discover how the trends that are changing the world can be used to enhance the performance of your portfolio. The 1999 European Wind Energy Conference and Exhibition was organized to review progress, and present and discuss the wind energy business, technology and science for

the future. The Proceedings contain a selection of over 300 papers from the conference. They represent a significant update to the understanding of this increasingly important field of energy generation and cover a full range of topics. This thesis deals with Rare Earth Elements (REE), especially with neodymium used in permanent magnets, from a very scientific basis by providing basic research data. Despite the fact that REE are newsworthy and very important elements for a considerable bandwidth of today's technologies, accompanied by the monopolistic supply-situation and Chinese politics, there are inexplicable data discrepancies about REE which have been recognized frequently but usually have not been addressed accordingly. So this analysis started with the hypothesis that the four application areas, namely computer hard disk drives (HDD), mobile phones, wind turbines and e-mobility (automotive traction), account for about 80% of the global annual neodymium-demand. The research methodology was a laboratory analysis of the composition of used magnets for HDDs and mobile phones and a literature and official report analysis of wind turbine and automotive neodymium use. The result was amazing and the hypothesis had to be withdrawn as these four areas only account for about 20% of neodymium use. This result raises some questions concerning actual use and thus potential recycling options. A distinguished group of international business scholars explore how firms internationalize in today's global economy. Just a decade ago, China maintained only a handful of operating wind turbines -- all imported from Europe and the United States. A detailed and critical analysis of the multiple types of entrepreneurship, helping students to understand the practical skills and theoretical concepts needed to create their very own entrepreneurial venture. Split into two parts, the book provides an even balance between

theory and practice. Part 1 covers the practical activities involved in new entrepreneurial ventures, and Part 2 uses the latest research to explore entrepreneurship from different perspectives. The expanded third edition of *Exploring Entrepreneurship* includes:

- Additional coverage of entrepreneurship and the United Nations Sustainable Development Goals (SDGs), corporate entrepreneurship, variety and diversity in entrepreneurship, and entrepreneurial approaches to the delivery of public services
- New and updated Case Studies that tackle cutting-edge practical issues
- New and updated Researcher Profiles from leading international scholars
- Enhanced Recommended Reading sections in each chapter with concise introductions to the latest research findings

Essential online resources for students, including selected SAGE journal articles, pre-reading suggestions, self-assessment questions and revision tips, plus a range of lecturer resources, are available. Suitable reading for students taking modules in Entrepreneurship or Small Business Management at upper undergraduate and postgraduate levels.

The coastal zone is the host to many human activities, which have significantly increased in the last decades. However, sea level rise and more frequent storm events severely affect beaches and coastal structures, with negative consequences and dramatic impacts on coastal communities. These aspects add to typical coastal problems, like flooding and beach erosion, which already leading to large economic losses and human fatalities. Modeling is thus fundamental for an exhaustive understanding of the nearshore region in the present and future environment. Innovative tools and technologies may help to better understand coastal processes in terms of hydrodynamics, sediment transport, bed morphology, and their interaction with coastal structures. This book collects several contributions

focusing on nearshore dynamics, and span among several time and spatial scales using both physical and numerical approaches. The aim is to describe the most recent advances in coastal dynamics. Winds sweeping through the Great Plains once robbed the Farm Belt of its future, stripping away overworked topsoil and creating the dreaded Dust Bowl of the 1930s. Today, those winds are bringing new hope to the declining rural communities of the central United States. Nowhere is wind's promise more palpable than in Cloud County, Kansas, where the soaring turbines of the Meridian Way Wind Farm are boosting incomes and bringing green jobs to a community that has, for decades, watched its children drift away. In *Harvest the Wind*, Philip Warburg brings readers face-to-face with the people behind the green economy—powered resurgence in Cloud County and communities like it across the United States. This corner of Kansas is the first stop on an odyssey that introduces readers to farmers, factory workers, biologists, and high-tech entrepreneurs—all players in a transformative industry that is taking hold across America and around the globe. In this illuminating book, Warburg reveals both the remarkable growth of a breakthrough technology and the formidable challenges it faces. He visits epicenters of anti-wind opposition as well as communities that have embraced wind farms as neighbors. He guides readers through an Iowa turbine assembly plant that is struggling to compete in a global marketplace dominated by European and Chinese manufacturers. And he looks at the thousands of miles that wind-generated power will need to travel to reach American consumers. *Harvest the Wind* is an earthly antidote to loftier treatises on global warming and green energy. By showing us how practical solutions are being implemented at the local level, Warburg offers an inspirational look at how we can all

pursue a saner and more sustainable energy future—while at the same time investing in the nation’s infrastructure and jumpstarting its economy. The difficulties in moving towards corporate sustainability raise the question of how environmental and social management can be integrated better with economic business goals. Over the last decade, the relationship between environmental and economic performance, and more recently the interaction between sustainability performance and business competitiveness, have received considerable attention in both theory and practice. However, to date, only partial aspects of the relationship between sustainability performance, competitiveness and economic performance have been studied from a theoretical as well as an empirical perspective. And, to date, no unique relationship has prevailed in empirical studies. A number of explanations have been put forward to explain this, including methodological reasons, such as the lack of statistical data, the low quality of that data, or the fact that such data is often available for short time periods only. Other theoretical explanations have been developed, such as the influence of different corporate strategies or the relatively small influence of environmental or sustainability issues as one factor among many on the economic or financial success of firms. So, how should the business case for sustainability be managed? This is the starting point for this book, which compiles insights on a large number of aspects of the link between sustainability performance, business competitiveness and economic success in an attempt to provide a comprehensive and structured view of this relationship. The book provides an unrivalled body of knowledge on the state of theory and practice in this field and identifies prospective future fields of work. The book includes: conceptual frameworks for the interaction of social,

environmental and economic issues in business environments; case studies of companies that have successfully integrated social, environmental and economic issues; analyses of the causal and empirical relationship between environmental and/or social performance, business performance and firm-level competitiveness; concepts and tools useful for improving business value with proactive operational strategies; assessment of the factors influencing operational sustainability strategies and their economic impact; and comparisons of interactions between sustainability performance and firm competitiveness across industry sectors and countries. *Managing the Business Case for Sustainability* is the definitive work in its field: the most comprehensive book yet published on the theory and practice of managing sustainability performance, competitiveness, environmental, social and economic performance in an integrated way. It will be essential reading for managers, academics, consultants, fund managers, governments and government agencies, NGOs and international bodies who need a broad and comprehensive overview of the business case for sustainability. This book discusses several product development strategies and tools employed by organizations around the world to implement frugal innovations. Over the past decade, frugal innovations have caught the attention of countless management scholars. This book comes at the right time for academics and practitioners alike, as it explores how the concept of frugal innovation has evolved over the past several years and is shifting its focus from merely featuring 'cost' driven innovations to being more 'resourceful' and 'sustainable' at its core. Furthermore, in light of the ongoing digital revolution and emergence of new business models such as sharing economy and circular economy, the book highlights recent and upcoming trends and their impacts on

frugal innovation strategies. Economic growth is highly dependent on technological progress and innovation, yet the sources from which these innovations originate are still largely misunderstood and untapped. Recent research has demonstrated that users, rather than manufacturers, are often a critical source of innovation in numerous fields from extreme sports to medical devices to software. This book systematically identifies the most important barriers to user-innovation and critically evaluates the democratization of innovation argument by critically assessing the main legal, economic, technological, and societal barriers to user-innovation for the first time and proposing alternative possibilities. Through original research the author reveals the dynamics of user-innovation and offers strategies for minimizing those factors that inhibit and stifle the spread of this phenomenon. From this analysis it becomes clear that user-innovation has become more difficult over time and that the problem is now of how manufacturers can enable users to overcome the discussed barriers and simultaneously benefit from such consumer-driven activities. Arguing that licenses are not just an important technology commercialization instrument but are tools critical to generating innovations, the author explains how licenses can in certain situations be employed to help users overcome some of the barriers to user-innovation. *User-Innovation: Barriers to Democratization and IP Licensing* is a practical guidebook as well as a startlingly original work of scholarship that will be essential reading for years to come. Explains and illustrates through case studies the four key sources of competitive advantage and financial success. This book is a theoretically rich and empirically grounded account of UK trade union engagement with climate change over the last three decades. It offers a rigorous critique of the mainstream neoliberal and ecological

modernisation approaches, extending the concepts of Marxist social and employment relations theory to the climate realm. The book applies insights from employment relations to the political economy of climate change, developing a model for understanding trade union behaviour over climate matters. The strong interdisciplinary approach draws together lessons from both physical and social science, providing an original empirical investigation into the climate politics of the UK trade union movement from high level officials down to workplace climate representatives, from issues of climate jobs to workers' climate action. This book will be of great interest to students and researchers in environmental politics, climate change and environmental sociology. Brendan Montague left Fleet Street to pursue his passion: reporting. But can bloggers take on bankers, conglomerates, polluters – and win? This book provides in-depth coverage of the latest research and development activities concerning innovative wind energy technologies intended to replace fossil fuels on an economical basis. A characteristic feature of the various conversion concepts discussed is the use of tethered flying devices to substantially reduce the material consumption per installed unit and to access wind energy at higher altitudes, where the wind is more consistent. The introductory chapter describes the emergence and economic dimension of airborne wind energy. Focusing on “Fundamentals, Modeling & Simulation”, Part I includes six contributions that describe quasi-steady as well as dynamic models and simulations of airborne wind energy systems or individual components. Shifting the spotlight to “Control, Optimization & Flight State Measurement”, Part II combines one chapter on measurement techniques with five chapters on control of kite and ground stations, and two chapters on optimization. Part III on “Concept Design & Analysis” includes three chapters that

present and analyze novel harvesting concepts as well as two chapters on system component design. Part IV, which centers on “Implemented Concepts”, presents five chapters on established system concepts and one chapter about a subsystem for automatic launching and landing of kites. In closing, Part V focuses with four chapters on “Technology Deployment” related to market and financing strategies, as well as on regulation and the environment. The book builds on the success of the first volume “Airborne Wind Energy” (Springer, 2013), and offers a self-contained reference guide for researchers, scientists, professionals and students. The respective chapters were contributed by a broad variety of authors: academics, practicing engineers and inventors, all of whom are experts in their respective fields.
