This book covers what an administrator needs to plan out and integrate a DMZ into a network for small, medium and Enterprise networks. In most enterprises the perception is that a firewall provides a hardened perimeter. However, the security of internal networks and hosts is usually very soft. In such an environment, a non-DMZ system that is offering services to the Internet creates the opportunity to leapfrog to other hosts in the soft interior of your network. In this scenario your internal network is fair game for any attacker who manages to penetrate your so-called hard perimeter. - There are currently no books written specifically on DMZs - This book will be unique in that it will be the only book that teaches readers how to build a DMZ using all of these products: ISA Server, Check Point NG, Cisco Routers, Sun Servers, and Nokia Security Appliances. - Dr. Thomas W. Shinder is the author of the best-selling book on Microsoft's ISA, Configuring ISA Server 2000. Customers of the first book will certainly buy this book. Companies are being forced to react to the growing individualization of demand. At the same time, cost management remains of paramount importance due to the competitive pressure in global markets. Thus, making enterprises more customer centric efficiently is a top management priority in most industries.

Mass customization and personalization are key strategies to meet this challenge. Companies like Procter&Gamble, Lego, Nike, Adidas, Land's End, BMW, or Levi Strauss, among others, have started large-scale mass customization programs. This book provides insight into the different aspects of building a customer centric enterprise. Following an interdisciplinary approach, leading scientists and practitioners share their findings, concepts, and strategies from the perspective of design, production engineering, logistics, technology and innovation management, customer behavior, as well as marketing. This book is a practical guide to the components of engineering management, using a holistic approach. It will help engineers and managers understand what they have to do to improve the product development process by deploying new technology and new methods of working in concurrent teams. The book takes elements from six well known and understood bodies of knowledge and integrates them into a holistic approach: integrated product development, project management, process management, systems engineering, product data management, and organizational change management. These elements are framed within an overall enterprise-wide architecture. The techniques discussed in this book work for both huge multinational organizations and smaller enterprises. Product Lifecycle Management (PLM): A Digital Journey Using Industrial Internet of Things (IIot) provides a summary of the essential topics of Product Lifecycle Management (PLM) and the Industrial Internet of Things (IIoT) in the era of Industry 4.0. The book discusses emerging technologies, their contribution towards enhancing product design, development, and manufacturing. It also presents the integration of PLM, Enterprise Resource Planning (ERP), and Manufacturing Execution System (MES) along with IIoT as well the integration of mechanical, electronic components, embedded systems, firmware and software focusing on smart design, development, and manufacturing in the digital transformation journey. The book provides a high-level overview of how the smart product development through smart manufacturing materializes within the smart ecosystem. Manufacturing professionals, designers, mechanical, electrical, electronics, instrumentation and industrial engineers, information and communication technology consultants and those working in production planning, process control, and operations will find this book invaluable. Computer-supported co-operative work (CSCW) is a research area that aims at integrating the works of several people involved in a common goal, inside a co-operative universe, through the sharing of resources in an efficient way. This report contains the papers presented at a conference on CSCW in design. Topics covered include: techniques, methods, and tools for CSCW in design; social organization of the CSCW process; integration of methods & tools within

the work organization; co-operation in virtual enterprises and electronic businesses; CSCW in design & manufacturing; interaction between the CSCW approach and knowledge reuse as found in knowledge management; intelligent agent & multi-agent systems; Internet/World Wide Web and CSCW in design; and applications & test beds. This report introduces a revealed preference methodology to estimate the value to the United States Air Force of expediting F-15 fighter jet programmed depot maintenance (PDM). The Air Force has chosen to pay for intermittent PDM on F-15s, so F-15s must have enough value after PDM visits to justify PDM costs. Computations suggest expediting F-15 PDM by a month would be worth at least \$75,000, but likely considerably more for younger aircraft. The engineering life cycle for complex systems design and development, where partners are dispersed in different locations, requires the set-up of adequate and controlled processes involving many different disciplines. The "design integration" and the final "system physical/functional integration and qualification" imply a high degree of cross-interaction among the partners. The - place technical information systems supporting the life cycle activities are specialized with respect to the needs of each actor in the process chain and are highly heterogeneous between them. To globally innovate in-place processes, specialists must be able to work as a unique team, in a virtual enterprise model. To this aim, it is necessary to make interoperable the different technical information systems and to define co-operative engineering processes, which take into account "distributed roles", "shared activities", and "distributed process controls". In this frame an innovative study, aimed at addressing this process with the goal of identifying proper solutions - in terms of design, implementation, and deployment - has been carried out with the support of the European Community and the participation of major industrial companies and research centers. This book provides an up-to-date account of the technologies, organizations and dynamics which constitute the digital economy, and assesses the impacts they have on regions and communities. This volume contains 108 full length papers presented at the 2nd International Conference on Electric and Electronics (EEIC 2012), held on April 21-22 in Sanya, China, which brings together researchers working in many different areas of education and learning to foster international collaborations and exchange of new ideas. This volume can be divided into two sections on the basis of the classification of manuscripts considered: the first section deals with Electric and the second section with Electronics. Agile Management and New Work concepts can be seen as promising trends. Or are they just passing fads whose end is already in sight? What about Digitalization? It is the basis of our lives today - both professionally and privately. But what's next? A trend toward virtual work or a revival of face-to-face collaboration? Let's take a look beyond and make a fair assessment. Recent advancements in information systems and computer technology have led to developments in equipment and robotic technology that have permanently changed the characteristics of manufacturing equipment. Equipment Management in the Post-Maintenance Era: A New Alternative to Total Productive Maintenance (TPM) introduces a new way of thinking to help high-tech organizations manage an increasingly complex equipment base. It also facilitates the fundamental understanding of equipment management those in traditional industries will need to prepare for the emerging microchip era in equipment. Kern Peng shares insights gained through decades of managing equipment performance. Using a systems model to analyze equipment management, he introduces alternatives in equipment management that are currently gaining momentum in high-tech industries. The book highlights the fundamental internal flaw in maintenance organizational setup, presents new approaches to replace maintenance functional setup, and illustrates a time-tested transformation and implementation process to help transition your organization from the maintenance era to the new post-maintenance era. Breaks down the history of equipment into five phases. Provides a clear understanding of equipment management fundamentals. Introduces alternatives in equipment management beyond the mainstream principles of maintenance management. The book examines maintenance management logistics, including planning and budgeting, training and people development, customer services and management, vendor management, and inventory management. Supplying a comprehensive look at the history of equipment management, it analyzes current maintenance practice and details approaches

that can significantly improve the effectiveness and efficiency of your equipment management well into the future. This book is about running modern industrial enterprises with the help of information systems. Enterprise resource planning (ERP) is the core of business information processing. An ERP system is the backbone of most companies' information systems landscape. All major business processes are handled with the help of this system. Supply chain management (SCM) looks beyond the individual company, taking into account that enterprises are increasingly concentrating on their core competencies, leaving other activities to suppliers. With the growing dependency on the partners, effective supply chains have become as important for a company's success as efficient in-house processes. This book covers typical business processes and shows how these processes are implemented. Examples are presented using the leading systems on the market - SAP ERP and SAP SCM. In this way, the reader can understand how business processes are actually carried out "in the real world". "This collection compiles research in all areas of the global information domain. It examines culture in information systems, IT in developing countries, global e-business, and the worldwide information society, providing critical knowledge to fuel the future work of researchers, academicians and practitioners in fields such as information science, political science, international relations, sociology, and many more"--Provided by publisher. Using this book you will learn how to: Record macros Control Custom Properties Create parts and features Build assemblies Batch create drawings Extract information from Workgroup PDM Create many other time saving utilities This is the only book available on building network DMZs, which are the cornerstone of any good enterprise security configuration. It covers market-leading products from Microsoft, Cisco, and Check Point. One of the most complicated areas of network technology is designing, planning, implementing, and constantly maintaining a demilitarized zone (DMZ) segment. This book is divided into four logical parts. First the reader will learn the concepts and major design principles of all DMZs. Next the reader will learn how to configure the actual hardware that makes up DMZs for both newly constructed and existing networks. Next, the reader will learn how to securely populate the DMZs with systems and services. The last part of the book deals with troubleshooting, maintaining, testing, and implementing security on the DMZ. The only book published on Network DMZs on the components of securing enterprise networks This is the only book available on building network DMZs, which are the cornerstone of any good enterprise security configuration. It covers market-leading products from Microsoft, Cisco, and Check Point Provides detailed examples for building Enterprise DMZs from the ground up and retrofitting existing infrastructures This volume contains case studies, theoretical papers and project development reports on one of the greatest challenges facing the new digital enterprises: the life cycle approach to management and production. Main issues discussed in the book include CAD/CAM/CIM/CAE, intelligent manufacturing, and control and robotics applications. "Despite spending more than \$600 billion on information technology over the past decade, the Federal Government has achieved little of the productivity improvements that private industry has realized from IT" according to the 25 Point Implementation Plan to Reform Federal Information Technology Management published by the White House in late 2010. "Too often, Federal IT projects run over budget, behind schedule, or fail to deliver promised functionality." This book argues that the Federal Government needs a new approach. Introducing a novel five-step process called

performance-driven management (PDM), author Ira Sachs explains in detail how to reduce risk on large IT programs and projects. This book walks through the five steps of the PDM process: conducting a high-level strategic review of what an organization does, who it serves, what it wants to do, and how it is going to do it; instituting performance measures to gauge success for the organization; completing comprehensive business cases for projects and using them to mitigate risk and manage projects throughout the project life cycle; performing benefits realization on completed projects; and establishing these best practices to achieve successful results in the future. This is an essential tool for all IT and business managers in government and contractors doing business with the government, and it has much useful and actionable information for anyone who is interested in helping their business save money and take on effective, successful practices. e-Design: Computer-Aided Engineering Design, Revised First Edition is the first book to integrate a discussion of computer design tools throughout the design process. Comprehensive coverage of essential elements for understanding and practicing the e-Design paradigm in support of product design, including design method and process, and computer based tools and technology Part I: Product Design Modeling discusses virtual mockup of the product created in the CAD environment, including not only solid modeling and assembly theories, but also the critical design parameterization that converts the product solid model into parametric representation, enabling the search for better design alternatives Part II: Product Performance Evaluation focuses on applying CAE technologies and software tools to support evaluation of product performance, including structural analysis, fatigue and fracture, rigid body kinematics and dynamics, and failure probability prediction and reliability analysis Part III: Product Manufacturing and Cost Estimating introduces CAM technology to support manufacturing simulations and process planning, sheet forming simulation, RP technology and computer numerical control (CNC) machining for fast product prototyping, as well as manufacturing cost estimate that can be incorporated into product cost calculations Part IV: Design Theory and Methods discusses modern decision-making theory and the application of the theory to engineering design, introduces the mainstream design optimization methods for both single and multi-objectives problems through both batch and interactive design modes, and provides a brief discussion on sensitivity analysis, which is essential for designs using gradient-based approaches Tutorial lessons and case studies are offered for readers to gain hands-on experiences in practicing e-Design paradigm using two suites of engineering software: Pro/ENGINEER-based, including Pro/MECHANICA Structure, Pro/ENGINEER Mechanism Design, and Pro/MFG; and SolidWorks-based, including

SolidWorks Simulation, SolidWorks Motion, and CAMWorks. Available on the companion website <http://booksite.elsevier.com/9780123820389> Bliss Bibliographic Classification, Second Edition is an outline composed of thorough and detailed analysis of the vocabulary of economics and management. The book is divided into two chapters. Chapter 1 includes concepts related to the subject, such as the schools of thought in economics, economic history and processes, supply and demand, the price and market system, and economic resources. Chapter 2, on the other hand, is an outline of different concepts related to management, such as the management of economic enterprises, management processes and functions, and management techniques. The text is recommended for economists and financial analysts, especially those who are making studies and are in need of a reference material. Product Lifecycle Management (PLM), a new paradigm for product manufacturing, enables a company to manage its products all the way across their lifecycles in the most effective way. It helps companies get products to market faster, provide better support for their use, and manage end-of-life better. In today's highly competitive global markets, companies must meet the increasing demands of customers to rapidly and continually improve their products and services. PLM meets these needs, extending and bringing together previously separate fields such as Computer Aided Design, Product Data Management, Sustainable Development, Enterprise Resource Planning, Life Cycle Analysis and Recycling. Product Lifecycle Management: 21st century Paradigm for Product Realisation explains the importance of PLM, from both the business and technical viewpoints, supported by examples showing how world-class engineering and manufacturing companies are implementing PLM successfully. The book: - introduces PLM, a unique holistic view of product development, support, use and disposal for industry worldwide, based on experience with internationally renowned companies; - shows you how to take full advantage of PLM, how to prepare people to work in the PLM environment, how to choose the best solution for your situation; - provides deep understanding, nurturing the skills you will need to successfully implement PLM and achieve world-class product development and support performance; and - gives access to a companion www site containing further material. Enterprise Modeling: Improving Global Industrial Competitiveness gives an overview of the current state-of-the-art in enterprise modeling and its application. Enterprise modeling is both a concept and a tool that is highly developed at the research level, but which still promises many new industrial applications. Enterprise models constitute a theoretical basis for the information system in an enterprise and are regarded by many as a substantial opportunity to improve global industrial competitiveness. Enterprise Modeling: Improving Global Industrial Competitiveness gives the reader an understanding of enterprise modeling as a concept and provides examples of its application by describing some of the currently available tools. It is organized in five parts:

overview and international trends, the basis of enterprise modeling, application areas, implementation, and industrial experience with enterprise modeling. Enterprise Modeling: Improving Global Industrial Competitiveness is useful to developers of business information systems, users of technical information systems, engineers within operations management, and engineers and economists dealing with performance assessment and improvement. Enterprise Modeling: Improving Global Industrial Competitiveness is suitable as a secondary text for a graduate level course, and as a reference for researchers and practitioners in industry. Product Design Modeling using CAD/CAE is the third part of a four-part series. It is the first book to integrate discussion of computer design tools throughout the design process. Through this book, you will: Understand basic design principles and all digital design paradigms Understand computer-aided design, engineering, and manufacturing (CAD/CAE/CAM) tools available for various design-related tasks Understand how to put an integrated system together to conduct all-digital design (ADD) Provides a comprehensive and thorough coverage of essential elements for product modeling using the virtual engineering paradigm Covers CAD/CAE in product design, including solid modeling, mechanical assembly, parameterization, product data management, and data exchange in CAD Case studies and tutorial examples at the end of each chapter provide hands-on practice in implementing off-the-shelf computer design tools Provides two projects showing the use of Pro/ENGINEER and SolidWorks to implement concepts discussed in the book Under the conditions of market economy, the government is an independent economic entity, whose function is not only to provide services and handle public affairs, but also to coordinate, advance and lead economic development. The dual functions of regional government include providing service and administration at the micro-level on behalf of market economy on one hand and leading, regulating and promoting economic development at the macro-level on behalf of the central government on the other hand. Foresighted leading means giving free rein to the government, especially regional government, in economic guidance, regulation and early warning. It also means that the government is responsible for effectively allocating funds and gaining advantages using market rules, leveraging market forces and other means such as investment, price, taxation, law, and organizational, institutional and technological innovations to promote the scientific and sustainable development of the regional economy. How to achieve harmonious project results across your entire organization. The international initiative on Enterprise Inter- and Intra-Organisational Integration (EI3-IC) had the objective to increase both international consensus (IC) and public awareness on enterprise integration. In these proceedings we intend to present the current status in inter- and intra-organisational integration for electronic commerce and thereby to further increase awareness and consensus within academia and industry about enterprise inter- and intra organisational integration. The conference proceedings contain the papers

presented at the ICEIMT conference in Valencia, Spain, selected papers presented at the different workshops and three papers on the initiative itself: overview, history and results. The proceedings follow the conference structure with each section (Parts 2 to 5) starting with the workgroup reports, followed by a particular view on the section theme and additional papers either presented at the conference or during the related workshop. Section editorials discuss the different contributions. As stated in the paper by Nell and Goranson in section 1 the results from all workshops indicate the important role of business processes in the area of e-commerce and virtual enterprises. Sharing relevant knowledge between cooperating partners and making it available for decision support at all levels of management and across organisational boundaries will significantly enhance the trust between the partners on the different levels of partner operations (strategy, policy, operation and transaction). Clearly business process modelling can significantly enhance establishment, operation and decomposition of the required collaboration. Addresses the field of enterprise systems, covering progressive technologies, leading theories, and advanced applications. Now more than ever, a company's success -- indeed its survival -- depends on a firmwide effort to create the best products and bring them to market quicker than competitors. Going beyond the traditional focus on design and production exclusively, product development expert Philip H. Francis provides senior managers with the methods and tools to orchestrate the entire enterprise for creating a legacy of product excellence. For the first time, Francis presents a holistic view of product creation--not just the core elements of engineering and industrial design, but also design's interface with manufacturing, the customer's voice and quality commitments, and the essential functions of technology management and leadership. From his unique vantage point as a former professor and researcher as well as a chief technology officer and director of advanced manufacturing technology, Francis presents the nine key business functions of new product development (NPD): manufacturing strategy, IT systems, issues of leadership and culture, customer satisfaction, quality, operations and measurement, intellectual property, the management of research and development, and technology. In immensely readable prose, Francis devotes a chapter to each function, explaining how managers can implement and manage each of these nine NPD functions. Francis enriches his arguments with real-world examples of triumphs and failures in a variety of industries, from consumer products such as furniture to business products such as networking software. He offers hands-on suggestions and strategies for every stage in the product development process, including "Ideas for Action" sections containing killer questions that can eliminate a product at any stage. Special sections of the book elaborate on the steps to take during key NPD processes. Written for those trained in technology as well as business-oriented industrial managers, Product Creation will be timely and necessary reading for CEOs, engineers, designers, marketing managers, IT officers, as well as

anyone concerned with product development from conception to market.
