**Introduction**The Nutrition Care Process is a well-known framework used in dietetic practice, which focuses on systematic problem-solving to assist with the development of evidenced-based nutrition interventions.<sup>1</sup> Despite many benefits associated with this framework, there are numerous barriers to the successful implementation of nutrition care process terminology (NCPT).<sup>2</sup>**Objectives**The primary research question was to determine the main barriers and facilitators for implementing NCPT in dietetic practice. The secondary objective was to provide recommendations to improve support for NCPT implementation and evaluation.**Methods**A literature search was conducted from November to December 2018 using the following databases: PubMed, Scopus, and OVID Medline. The inclusion criteria was research focusing on the implementation and/or evaluation of NCPT. Exclusion criteria included non-English articles and papers published before 2005, as this was the year that the Academy of Nutrition and Dietetics invited Canada to adopt the NCPT framework.<sup>1</sup> Studies were organized based on inclusion of NCPT implementation, evaluation, or both. Key barriers and facilitators to

NCPT implementation and future recommendations were summarized. Resultsu2022 12 studies met the inclusion criteria: U.S.A (n=6), Australia (n=3), Sweden (n=2), Switzerland (n=1)u2022 Main facilitators were project champions with change management experience and group-based learning.u2022 Major barriers included a lack of support, time, and knowledge related to NCPT implementation.u2022 Recommendations for improvements were ongoing training and education for registered dietitians (RDs) to improve the quality of their documentation, and additional research to evaluate the impact of NCPT on nutrition care outcomes.ConclusionsContinual education is required to support RDs with effectively incorporating NCPT into their practice. Moreover, further research is warranted to justify the validity and reliability of NCPT application, particularly in the Canadian healthcare context.Significance to the Field of DieteticsThe present study may help enhance current NCPT implementation strategies, and serve as a guide for subsequent research to evaluate the impact of NCPT on patient care. Malnutrition and obesity are both common among Americans

over age 65. There are also a host of other medical conditions from which older people and other Medicare beneficiaries suffer that could be improved with appropriate nutritional intervention. Despite that, access to a nutrition professional is very limited. Do nutrition services benefit older people in terms of morbidity, mortality, or quality of life? Which health professionals are best qualified to provide such services? What would be the cost to Medicare of such services? Would the cost be offset by reduced illness in this population? This book addresses these questions, provides recommendations for nutrition services for the elderly, and considers how the coverage policy should be approached and practiced. The book discusses the role of nutrition therapy in the management of a number of diseases. It also examines what the elderly receive in the way of nutrition services along the continuum of care settings and addresses the areas of expertise needed by health professionals to provide appropriate nutrition services and therapy.
