Excerpt from d104-Book of General Pathology In modern times physiology and pathology had a common starting-point in the doctrine of the cell as the ultimate unit of the animal body; but, nevertheless, they tended for many years to diverge. Physiology was concerned chiefly with certain specialized functions of cells, the phenomena of which hardly touch the problems of disease, and was hampered in its progress by the backward condition of such ancillary sciences as chemistry and physics. Pathology, greatly influenced by anatomy, was engaged with the

observation of results rather than the elucidation of the underlying vital processes. Within recent years, however, the two sciences have converged again, for not only has the scope of physiological inquiry regarding the intimate processes of cellular life been broadening, but pathology, in recording such phenomena as those of perverted secretion or the effects of morbid cellular life on normal functions, has opened up new lines of inquiry for the physiologist. Disease, in fact, has often supplied physiological experiments far more delicate than any that could be performed in the laboratory. There is thus at present a constant interaction of the two sciences; the way has thus been opened up for the elucidation of the doctrine often foreshadowed by the older pathologists that the laws of disease are really the laws of health, and lack of co-ordination between the normal activities of the component tissues of the body is often the most important factor in the origin of disease. Although the establishment of these principles is still very incomplete, it has seemed to the editors of this book that the time has come for another attempt to present, as far as it may be possible, the results obtained by the two sciences in working at the problems of disease. Excerpt from New Aspects of Diabetes: Pathology and Treatment We may turn first to some theoretical questions. However, I will restrict the discussion to those problems which have an immediate bearing upon the treatment of diabetes and which it is necessary to understand if the patient shall be well treated. Some of these matters were referred to in my previous lectures, but none of them could be explained with such certainty as they can to-day, and in many of the most important ones the answers are quite otherwise than what was expected seven years ago. Excerpt from *An Introduction to Pathology and Morbid Anatomy* Our guiding principle in modern pathology is that we have to deal not with new tissue-cells and functions, but simply with disturbances of ordinary elements and functions. It is obvious, therefore, that for the purpose of studying disease our acquaintance with the body in health cannot be too intimate. New cells (bacteria), and even entire animals (parasitic worms), are frequently introduced into the tissues, but as causes, not products, of disease. Pathology: A Manual for Students and Practitioners The plan adopted is to follow the tissue from
the body to the microscope, to describe the method of making the post mortem and naked eye
examinations, and of preparing the various structures for microscopic investigation. The more
important changes of each organ are indicated, though all the changes which occur could not
possibly be considered in the space at command. In all cases the aim has been' to describe at least
the more important typical lesions. In as many instances as possible, illustrations, which are not
mere diagrams, are added. Most of the original Drawings have been made from Sections
prepared in the course of the work of the Edinburgh University Practical Pathology Class. They
may therefore be accepted as representing as faithfully as possible the appearances which may be
recognised by any normally intelligent and dexterous student. The copied Drawings, taken from
the best sources, are, as far as possible, acknowledged in the descriptions. About the Publisher

Excerpt from *Studies in Pathology and Therapeutics* The discussion of the nature, origin, and cause of diseases has become emphatically practical. In the progress of scientific research, our profession has proved itself unwilling to trust any longer to absolute empiricism in therapeutics, and we feel ourselves compelled to follow some definite methods of logical reasoning, in explanation of the various modes of treatment suggested for the vast variety of maladies which fall under our observation and care. We must decide, each for himself, at the outset of our career, what course we shall pursue. If disease be merely an exaggeration and intensification of health; if fever consist merely in augmentation of vital heat, as Parkes and Ringer seem to maintain, and Aitken seems to admit; if inflammation be mere phlogosis; if all irritation, with its vast diversity of phenomena, be, as Broussais would have it, mere excitement of normal irritability; then, following Broussais, we shall be content with subtracting from its pabulum, with abating the inordinate vis vit; absolute diet and leeches and gum-water will constitute our therapeutic arsenal. If, with Brown, and Todd, and Chambers, we look upon it as essentially asthenic, as consisting in abatement of vital power on the other hand; we shall trust for "the renewal of life" in stimulants, cordials, and nutritious food and drinks. If we regard it as an effort of a special restorative, or protective agent - a vis

medicatrix - "an inherent curative power," we shall be careful how we interfere with it; we shall be content with the most patient expectancy, and institute no measures, unless in subserviency and correspondence with the movements of nature. Excerpt from The Elements of Pathology This little work does not pretend to be

a text-book. The author expects, rather, that the majority of his readers are already conversant with the subjects herein treated. Nor is it desired to compete with any of the excellent treatises on this branch of medicine which have appeared in such gratifying numbers during the last few years. His aim has been simply to establish the natural groundwork which must exist in this, as well as in every natural science, and to place it in as clear a light as possible. These efforts have, in the course of several years, culminated in this little book, which is now issued with the hope of eliciting the opinions of his confreres. Excerpt from A d104-Book of Mycology and Plant Pathology The following pages represent in a much extended form the lectures and laboratory exercises given by the author before his botanic classes at the University of Pennsylvania, and before public audiences else where, especially, Farmers' Institutes with which he has had three ye'ars' experience as a lecturer in Pennsylvania. The arrangement of the text has been suggested by the needs of the classroom and from an acquaintance with similar work in other colleges and universities in America. It is hoped that the book and the suggestions, as to teaching which it contains, will appeal to those responsible for similar courses. The keys are given with the anticipation that they will prove useful to the student and teacher who desire exercises in the classification of the fungi: The illustrations have been chosen with care, and credit is given in all cases for those borrowed from other books and monographs. Excerpt from Gleet: Its Pathology and Treatment, Vol. 2 In publishing this treatise on Gleet, my intention is to elucidate some essential points which are very often neglected, and to make its pathology more generally and more fully known. I not only state instances of my success, but also of my failure, indicating that form of Gleet which may be cured by medicine and that which requires surgical treatment. I purposely omitted to fill my pages with long accounts of cases, because the histories of cases are of late related so much in consonance with the writer's preconceived ideas on the subject, that the profession at large has begun to lose confidence in them. I consider that accounts of cases are only valuable when they are publicly observed, as in hospitals, in the presence of witnesses. Excerpt from *Mental Pathology and Therapeutics* Several of the most recent writers on insanity have been so well pleased with the first edition of my book that they have assumed into their writings not only the ideas and doctrines, the arrangement and example contained in it, but have even taken, without restraint, as their own, simple excerpts of whole sections. I quietly permitted this to occur, but now it would, of course, be dimble to me if any one were to think that it was I who, in this edition, had borrowed from those authors. I would therefore beg of the reader, wherever doctrines, pages, and even chapters, occur similar, or nearly similar, to what they may shortly before have read in books or journals, simply to compare them with the first edition of this work which appeared in 1845.

Excerpt from *A Laboratory Syllabus of Clinical Pathology* Every teacher of clinical pathology, no doubt, has observed, with alarm, the rapid growth in volume of the subject-matter which he is obliged to take up in his classes, while the number of hours that are placed at his disposal for this purpose is remaining practically the same. Not many years ago the course in clinical microscopy, as it was then and is still at times wrongly called, was largely a course in what the name then suggested, viz., a course in the microscopic examination of the blood and the various secretions and excretions of the body, coupled with a relatively meager review of some of the simpler methods of chemical analysis of the same material. Excerpt from *The Internal Secretions: Their Physiology and Application to Pathology* The translation has been made quite freely; no literal rendering of the French text has been attempted. Great care has, however, been taken to express the spirit of the author in clear and simple English. No additions of any consequence have been made because it was deemed best to leave the text as originally presented by the author. Several additional paragraphs sent in by Professor Gley, especially for this edition, have been incorporated with a view to bringing the work up to date, and to elucidate some points which needed amplification. Excerpt from *A Treatise on Physiology Applied to Pathology* The cause of medicine has suffered, as well from the neglect of

physiology, as from the defective method of teaching it. Functions have been described too much in the abstract, without a due attention to the modifying agents of hygiene, and the gradual conversion of the phenomena of health into the painful disturbances of disease. As well might we hope to become acquainted with the moral nature of man, by a knowledge of his disposition in a state of primeval innocence. For all useful and practical purposes, the nearest approach to good is made by knowing how to evade and repel evil. It is of very little moment for us to learn the precise quantity of blood circulating in the arteries and veins, the mechanism of the stomach's contraction, or the nature of the fluid, aura, or vibration of which the nerves are conductors. What most interests in the functions of these parts, is to be aware of the causes which unduly accelerate or disturb the action of the sanguiferous system, retard the changes of ingested substances into chyle, and modify, alter, and pervert the ability of the nervous system to receive impressions, experience sensations, and transmit the orders of volition. Mechanical physiology and the study of healthy function will doubtless prove interesting to the gentleman scholar, and the person addicted to natural history, but they are poorly calculated to meet the wants and gratify the wishes of the physician. They are as barren of results, favourable to the healing art, as a system of materia medica made up of an enumeration of the sensible properties of medicines, and dogmatic statements of the diseases in which they are useful, without any explanation of their mode of operation, or the variety of effects dependent on the particular condition of the organs to which they are applied, and the intensity and duration of the morbid symptoms, which they are intended to palliate or remove. Excerpt from A Text-Book of Pathology Except in a few instances, discussion of methods of examination has been omitted, because it seemed unwise to increase the size of the book with matter that is appropriately presented in special works on technique. For similar reasons the author has decided to exclude the pathology of the skin and of the organs of special sense. Controversial matter has been avoided as much as possible, excepting in certain parts of the sections on General Bacteriology and on Neuropathology, in which it seemed proper to discuss conflicting theories. Full use has been made of works on pathology and of special monographs in English as well as in French and German. Excerpt from Contributions to Mental Pathology The contents of this volume, with two exceptions, have already appeared in print. I am induced to put them into a more accessible shape, for the reasons that, since their first appearance, the subjects they discuss have lost none of their original interest; that many of the questions they present are far from being settled; and that the public are seeking for information respecting a disease that has most important relations to private happiness and social order. In making this selection from a much larger number of contributions to the literature of insanity, I have chosen such only as present the disease in those aspects which have become peculiarly interesting, either from a signal advance in knowledge, or some particular circumstance of the time, or some remarkable social, legal, or aesthetic relation. Though written on different occasions, the reader will find them,

It trust, not. Entirely deficient in that unity of doctrine and purpose which is expected in a systematic treatise. They are given new with scarcely any other alteration than an occasional change. Excerpt from *Outlines of Gynaecological Pathology and Morbid Anatomy* I have endeavoured to express the more modern views of British Pathologists, especially those of my teachers at St. Bartholomew's Hospital, to whom I owe so much. I have

taken the greatest care to give references to all authors, both British and Foreign, whose works are quoted in this book. This may also be of convenience to those who wish to go further into any special subject, or to students who wish to look up particular papers for examination purposes or other reasons. Excerpt from Contributions to the Pathology and Practice of Surgery When a famous oculist confessed that his skill had been acquired at the expense of destroying a hatful of eyes, and a late no less distinguished surgeon declared, that experience in his department of the profession could be attained only by wading through blood, it is to be feared that, although the language might be somewhat rough, the statements were founded on truth.
