[Fuzzy Logic in Financial Analysis](#) May 29 2020 In today's increasing complex and uncertain business environment, financial analysis is yet more critical to business managers who tackle the problems of an economic or business nature. Knowledge based on formal logic and even experience becomes less sufficient. This volume systematically sets out the basic elements on which to base financial analysis for business in the new century. It incorporates a previous work that can serve as the basis and foundation to the new contributions that are now being made in the field of financial economy and intend to provide business with instruments and models that are suitable for the treatment of the new economic context. In dealing with rapid and unpredictable changes in technological and business conditions, it postulates a growing reliance on the opinions of experts instead of past data or probabilistic forecasts, which is a radical change but may yield fruitful results. For this reason, much emphasis is devoted to the problem of aggregation of the opinion of experts in the financial field, with the object of limiting, wherever possible, the subjective component of the opinions and making sure that the decisions have the best guarantee of reaching the desired objectives.

Value Dominant Logic Jul 24 2022 Increasing disruption, diminishing returns, and demanding customers require business leaders to create more value, remain relevant, and stay ahead of competition. CEOs must evolve a "value creation" culture for the company in order to properly balance the interests of customers, employees, investors, and the marketplace. People who succeed, succeed because they create value, but they do so unconsciously. Creating value consciously makes you create more value and destroy less value. Doing something good or improving the well-being of someone creates value. You buy and re-buy a product on a value basis. Value dominant logic is relevant to all of us. Value creation is used in all fields, but is not well understood. This book takes value creation to the next level, showing how value is basic to human endeavor and is not focused on enough even when we try to create value. Most books on value creation focus on creating monetary value for companies. This book suggests that value is greatly created and enhanced by creating value for others. To create value for customers, one must first create value for the providers, including employees, suppliers, and the society at large. The goal is to improve the quality of life and well-being. This book provides ways of implementing these thoughts and educates readers about value and how to create it.

Frege Feb 25 2020 This book is about Gottlob Frege. The guiding thought is that Frege left philosophy a legacy which has been largely ignored, not least of all by his admirers. In order of logical priority, Frege's first concern was to locate the law-like behaviour of truths and falsehoods merely by virtue of their being such (in his terms, the structure of *Wahrsein*). The just-mentioned legacy lies in his first step towards that goal. It consists in winnowing the 'logical' from the 'psychological', the business of being true as such from that of holding, or holding forth as true-and to keep these separate. A first lesson: what belongs to what is thus abstracted cannot be read directly back into what it was abstracted from. This is what is most widely ignored. The book is divided in three parts. The first presents Frege's general picture of the business of being true-of what belongs to the abstraction. The second is primarily concerned with steps Frege takes (in print) between 1891 and 1895, to pave the way for what became, after logic itself, his central project, that whose attempted carrying out is contained in *Grundgesetze I*. The third part concerns views of logic, truth, the inexorableness of logic, which Frege eventually came to hold, and what it might be to study 'The Mind' as opposed to minds.

The Logic of Priorities Mar 08 2021 This book presents applications of the Analytic Hierarchy Process developed by Thomas L. Saaty to deal with unstructured decision problems, together with case histories developed by him and in collaboration with others in areas of current societal concern. Its purpose is to provide the reader with examples of how to deal with unstructured problems, particularly ones involving socio economic and political issues with qualitative and intangible factors. These examples show how to use judgment and experience to analyze a complex decision problem by combining its qualitative and quantitative aspects in a single framework and generating a set of priorities for alternative courses of action. The process has inherent flexibilities in structuring a problem and in taking diverse judgments from people, whether singly, in a group working together, or by questionnaire. Decisionmakers will profit from this approach. It makes accessible to them a framework for understanding the complexity of the system they are in as it impinges on the surrounding environment. To deal with complexity, we must first understand it. Systems thinking is necessary if all the important factors are to be considered. Complex systems problems can challenge and tax our logical capability to fully understand their causes and the consequences of any action we may take to solve them. Nevertheless, in time their effects on us tend to become better known than their causes.

Service Logic Jul 12 2021 "What is service logic? What does it mean to manage and analyze organizations based on a perspective of service logic? Service logic may be contrasted with a goods logic, which used

to maintain a dominant position not only in the private and public sector, but also in research in relation to marketing and organizations. According to a goods logic, value is created internally in organizations, whereas a service logic suggests that value is created by customers when using goods or services. Service logic not only alters the ways in which service innovation occurs, but also the ways in which organizations, customers and other actors collaborate. In this book, key concepts related to service logic are explained, such as value co-creation and resource integration. It also brings up how service innovation is carried out from the perspective of a service logic and how actors co-create value in service ecosystems. Furthermore, the book also presents a large number of examples involving online companies such as Spotify, traditional service firms such as Ikea, industrial companies such as Volvo and public organizations such as the Swedish Tax Authority."
