The blinding diseases of inherited retinal degenerations have no treatments, and age-related macular degeneration has no cures, despite the fact that it is an epidemic among the elderly, with 1 in 3-4 affected by the age of 70. The RD Symposium will focus on the exciting new developments aimed at understanding these diseases and providing therapies for them. Since most major scientists in the field of retinal degenerations attend the biennial RD Symposia, they are known by most as the "best" and "most important" meetings in the field. The volume will present representative state-of-the-art research in almost all areas of retinal degenerations, ranging from cytopathologic, physiologic, diagnostic and clinical aspects; animal models; mechanisms of cell death; candidate genes, cloning, mapping and other aspects of molecular genetics; and developing potential therapeutic measures such as gene therapy and neuroprotective agents for potential pharmaceutical therapy. While advances in these areas of retinal degenerations will be described, there will be many new topics that either were in their infancy or did not exist at the time of the last RD Symposium, RD2014. These include the role of inflammation and immunity, as well as other basic mechanisms, in age-related macular degeneration, several new aspects of gene therapy, and revolutionary new imaging and functional testing that will have a huge impact on the diagnosis and following the course of retinal degenerations, as well as to provide new quantitative endpoints for clinical trials. The retina is an approachable part of the central nervous system (CNS), and there is a major interest in neuroprotective and gene therapy for CNS diseases and neurodegenerations, in general. It should be noted that with successful and exciting initial clinical trials in neuroprotective and gene therapy, including the restoration of sight in blind children, the retinal degeneration therapies are leading the way towards new therapeutic measures for neurodegenerations of the CNS. Many of the successes recently reported in these areas of retinal degeneration sprang from collaborations established at previous RD Symposia, and many of those will be reported at the RD2018 meeting and included in the proposed volume. We anticipate the excitement of those working in the field and those afflicted with retinal degenerations will be reflected in the volume. The scope of the book is to highlight the diverse roles of cilia in human development and disease. Almost all cell types form cilia and although they were first detected about 200 years ago, their significance was unclear. In the past ten years, it has become obvious that cilia have got sensory functions, as well as roles in motility and their mis-formation or the deregulation of the signaling pathways they control has been associated with defective development and human disease. Although research has concentrated on the role of the cilium in each organ, no effort has been made so far to bring all this information together and relate it to the various human diseases. This book aims to gather all the expertise that has been acquired on primary cilia and translate it into a medical and research context that will be of interest to postgraduate students, researchers, medics and scientists.

-Comprehensive, multi-disciplinary text addressing all aspects of head and neck cancer and crosses a wide spectrum of specialists, including surgical, radiation and

medical oncologists, dentists, pathologists, radiologists, and nurses. -8 new chapters - 9 with new authors -Revisions highlight new techniques and imaging -New imaging emphasizes diagnostics, image guided therapies, follow-up imaging, and novel imaging approaches -Less basic science and more clinical diagnostics and management -25% new illustrations, along with more color images to assist in diagnostics and therapeutics Squamous cell carcinoma of the oral cavity (SCCOC) is one of the most prevalent tumors of the head and neck region. Despite improvements in treatment, the survival of patients with SCCOC has not significantly improved over the past several decades. Most frequently, treatment failure takes the form of local and regional recurrences, but as disease control in these areas improves, SCCOC treatment failures more commonly occur as distant metastasis. The presence of cervical lymph node metastasis is the most reliable adverse prognostic factor in patients with SCCOC, and extracapsular spread (ECS) of cervical lymph nodes metastasis is a particularly reliable predictor of regional and distant recurrence and death from disease. Decisions regarding elective and therapeutic management of cervical lymph node metastases are made mainly on clinical grounds as we cannot always predict cervical lymph node metastasis from the size and extent of invasion of the primary tumors. Therefore the treatment of the neck disease in the management of SCCOC remains controversial. The promise of using biomarker-based treatment decisions has yet to be fully realized due to our poor understanding of the mechanisms of regional and distant metastases of SCCOC. We will summarize the current status of investigations into SCCOC metastases and potential of these studies to impact basic research investigators and clinicians confronting SCCOC in the future.

Dyneins: The Biology of Dynein Motors, Second Edition, offers a broad view of dyneins from structure, composition and organization, to biology of dynein function in both cytoplasm and cilia. As the second book in a pair on this topic, these works provide an overview of dyneins, from structure and function, to dysfunction and disease. Since the first edition, enormous strides have been taken in understanding dynein structure, its organization in the axoneme, single molecule motor mechanics and the consequences of defects for human biology, disease and development. This second edition is extensively revised, with coverage expanded from 24 to 42 chapters. Much of the expanded coverage occurs in Volume Two on dynein dysfunction and disease, such as the role of dynein and cancer, while Volume One covers the history and evolution of dyneins, dyneins in ciliary biology and cytoplasmic dynein biology. Presents a broad-based, up-to date view of the biology of dynein motors Discusses approaches from genetics, molecular biology, biochemistry and biophysics Includes a companion website with movies of dynamic cell behavior Covers the topic in comprehensive chapters written by world experts In May 1970 the 25th anniversary of the liberation of the Netherlands was celebrated in the King's Library of the British Museum with an exhibition of Dutch clandestine printing. The books shown were part of the considerable collection assembled in the intervening years by Miss Anna Simoni in the course of her official

duties in the Department. It has been decided that the size and quality of this collection justify the publication of a catalogue. For this, and the full indexes which have been provided, credit is also due to Miss Simoni. The British Library Board wishes to express its deep appreciation of the generosity of the donors and helpers whose names are mentioned in the introduction. K. B. INTRODUCTION

The Second World War saw German rule extended over many countries where most of the people were fundamentally opposed to the Nazi ideology. In all these enslaved nations Resistance movements sprang up and they took various forms, one of the most important of which was the work of the illegal press. In the Netherlands, as elsewhere, under ground newspapers were of the greatest political importance. At the same time a large number of pamphlets helped to strengthen the people's will to continue the struggle and to form public opinion on future developments. *Woordeloos tot verhaal* is in menig opzicht een baanbrekend werk. Het brengt 24 onderzoekers uit verschillende disciplines bij elkaar om vanuit een scala van perspectieven helderheid te verschaffen over het trauma als centraal gegeven in de menselijke samenleving. Nieuw is tevens de samenwerking tussen Afrikaanstalige en Nederlandstalige auteurs. Zij hebben elkaar gevonden vanuit een gemeenschappelijke belangstelling en werden gestimuleerd door de verwantschap tussen hun talen. Along with its companion volume on intraflagellar transport, this book provides researchers with a comprehensive and up-to-date source of methods for the analysis of cilia and flagella, focusing primarily on approaches that have been devised or significantly extended since the last volume of *Methods in Cell Biology* on this topic (volume 47, 1995). Edited by Stephen M. King and Gregory J. Pazour, the newest installment of this highly acclaimed serial will serve as an essential addition to the study of cilia and flagella.

- \* Covers protocols for cilia and flagella across systems and species
- \* Both classic and state-of-the-art methods readily adaptable across model systems, and designed to last the test of time
- \* Relevant to clinicians interested in respiratory disease, male infertility, and other syndromes who need to learn biochemical, molecular, and genetic approaches to studying cilia, flagella, and related structures

Since 1984, we have organized satellite symposia on retinal degenerations that are held in conjunction with the biennial International Congress of Eye Research. The timing and location of our Retinal Degeneration Symposia have allowed scientists and clinicians from around the world to convene and present their exciting new findings. The symposia have been arranged to allow ample time for discussions and one-on-one interactions in a relaxed atmosphere, where international friendships and collaborations could be established. The IXth International Symposium on Retinal Degeneration was held on October 9-14, 2000 in Durango, Colorado and was attended by over 100 scientists from six continents. This book contains many of their presentations. Several events of note occurred at this meeting. First, thanks to the generous support of the Foundation Fighting Blindness, we were able to sponsor the travel of 11 young scientists from six countries. Most of them have contributed chapters to this volume. The response to the travel program was so overwhelming that we will make it a regular feature of our meeting. This will allow other bright, young investigators to be introduced to the world experts who study retinal degenerations. Second, about 40% of the scientists who attended this meeting were there for the first time. We believe that this indicates a growing interest in retinal degeneration research and ensures that new talent will be attracted to this important area of investigation. The symposium received support from several organizations. *Advances in Immunology*, a long-established and highly respected publication, presents current developments as well as comprehensive reviews in immunology. Articles address the wide range of topics that comprise immunology, including molecular and cellular activation mechanisms, phylogeny and molecular evolution, and clinical modalities. Edited and authored by the foremost scientists in the field, each volume provides up-to-date information and directions for the future. This volume focuses on tumor immunology. Contributions from leading

authorities Informs and updates on all the latest developments in the field Designed as a practical reference guide for professional pianists and piano teachers, *A Guide to Piano Music by Women Composers, Volume I*, is an annotated catalogue of the available piano music in print composed by 144 women born before the 20th century. The work also features biographies and extensive bibliographical information for each composer. Arranged alphabetically by composer into categories including single works, collections, and anthologies, the music is also described in terms of grade level, genre, mood, style characteristics, and technical requirements, and ranges in difficulty from late elementary to virtuoso concert repertoire. Far too many teachers, students, professional musicians, and audiences are unaware of the contributions made by women in music, and of the beauty and merit of their specific compositions. This reference work provides an invaluable addition to the current literature. This book will contain the proceedings of the XIV International Symposium on Retinal Degeneration (RD2010), held July 13-17, 2010, in Mont-Tremblant, Quebec, Canada. The volume will present representative state-of-the-art research in almost all areas of retinal degenerations, ranging from cytopathologic, physiologic, diagnostic and clinical aspects; animal models; mechanisms of cell death; candidate genes, cloning, mapping and other aspects of molecular genetics; and developing potential therapeutic measures such as gene therapy and neuroprotective agents for potential pharmaceutical therapy. This book provides comprehensive information on the genetics of eye diseases affecting various parts of the eye, and addresses a range of genetic etiologies. These diseases include several hereditary disorders of anterior and posterior segment, and with different genetic etiologies. The genetics of eye diseases is a field that has been rapidly growing over the last two decades, and comprises a vast area with considerable clinical and genetic heterogeneity. The main goal of this work is to discuss the status quo of genetics for each of the disorders covered, and to highlight unusual or atypical patterns of inheritance and genetic associations. For each relevant gene, it describes the pathogenic associations and variants, genotype-phenotype correlations, and functions at the cellular and molecular level. *Genetics of Eye Diseases* offers a valuable reference guide for geneticists and clinicians alike, while also providing a comprehensive overview of the field for graduate and doctoral-level students. In addition to sharing essential information on the genetics of each disease, it highlights recent advances that are representative of the developments in the field as a whole. An analytic and historical perspective of literary texts to understand the position of domestic workers in South Africa More than a million black South African women are domestic workers. Precariously situated between urban and rural areas, rich and poor, white and black, these women are at once intimately connected and at a distant remove from the families they serve. Ena Jansen shows that domestic worker relations in South Africa were shaped by the institution of slavery, establishing social hierarchies and patterns of behavior that persist today. *Like Family* is an updated version of the award-winning Soos familie (2015) and the highly-acclaimed 2016 Dutch translation, *Bijna familie*. The prevalence of Oral and Oropharyngeal Cancer continues to rise worldwide, related to the increase in

consumption of tobacco, alcohol and other carcinogenic products. However, there has also been a significant reduction in mortality due to increasing awareness, early diagnosis and advances in treatments. This second edition of a bestseller reviews every aspect of the diagnosis and treatment of the orofacial cancer patient. As with the first edition, the book is organized in three parts, covering Pathology and Biology, Clinical Management, and Outcomes and Follow-up. Authored by 17 international researchers and research teams, the book provides up-to-date insights on topics in five different research areas related to normal hearing and deafness. Techniques for assessment of hearing and the appropriateness of the Mongolian gerbil as a model for age-dependent hearing loss in humans are presented. Parental attitudes to childhood deafness and role of early intervention for better treatment of hearing loss are also discussed. Comprehensive details are provided on the role of different environmental insults including injuries in causing deafness. Additionally, many genes involved in hearing loss are reviewed and the genetics of recessively inherited moderate to severe and progressive deafness is covered for the first time. The book also details established and evolving therapies for treatment of deafness. This volume summarizes the new developments that made subcellular proteomics a rapidly expanding area. It examines the different levels of subcellular organization and their specific methodologies. In addition, the book includes coverage of systems biology that deals with the integration of the data derived from these different levels to produce a synthetic description of the cell as a system. This unique book provides a thorough overview of developing molecular cancer diagnostic assays, which are the prerequisites for optimal solutions within personalized cancer medicine. The book takes the reader through definitions of the pharmacodiagnostic concept, historical perspectives of the early steps into molecular cancer diagnostics linked to therapy, the basis of different diagnostic molecular techniques, ongoing research, drug-diagnostic co-development, assay validation, clinical trial methodology, regulatory issues around pharmacodiagnosics and future aspects within personalized cancer medicine. With the increasing availability of omics data and mounting evidence of the usefulness of computational approaches to tackle multi-level data problems in bioinformatics and biomedical research in this post-genomics era, computational biology has been playing an increasingly important role in paving the way as basis for patient-centric healthcare. Two such areas are: (i) implementing AI algorithms supported by biomedical data would deliver significant benefits/improvements towards the goals of precision medicine (ii) blockchain technology will enable medical doctors to securely and privately build personal healthcare records, and identify the right therapeutic treatments and predict the progression of the diseases. A follow-up in the publication of our book *Computation Methods with Applications in Bioinformatics Analysis* (2017), topics in this volume include: clinical bioinformatics, omics-based data analysis, Artificial Intelligence (AI), blockchain, big data analytics, drug discovery, RNA-seq analysis, tensor decomposition and Boolean network. Throughout history women have been composing music, but their achievements have usually gone unrecognized. This book presents new and noteworthy research into retinal diseases. It focuses on what we currently know about the environment, genetics and mechanisms that lead to retinal degenerations, new diagnostics, and innovative therapeutic modalities to preserve vision. Written by renowned scientific investigators, this innovative collection of treatment strategies and technological discoveries allows for the realistic translation of research into practice. The ciliopathies are a group of rare diseases that often affect multiple systems within the body, and are caused by defects in the function or structure of cilia. When cilia go wrong, there are profound consequences; these are discussed in detail for the first time in *Ciliopathies: a reference for clinicians*. The book provides a clinical overview and reference to this newly emergent group of disorders ranging from Alström syndrome to putative ciliopathic disorders. Each chapter provides an in-depth discussion on a specific disorder, including the latest scientific research together with a description of its features, and practical guidelines on diagnosis. The authors also examine the evidence for dysfunction of cilia in cancer and more common disorders. *Ciliopathies: a reference for clinicians* will appeal to those involved in the care of patients with ciliopathies, including specialists in the fields of nephrology, diabetes, cardiology, and ophthalmology, and non-clinical researchers interested in cilia biology. Issues for Nov. 1957- include section: Accessions. Aanwinste, Sept. 1957- Authoritative, creative, and groundbreaking original literary essays about an important emerging area of study. Squamous cell cancers of the head and neck (SCCHN), also known as head and neck cancers (HNC) encompass malignancies of the oral cavity, larynx, nasopharynx and pharynx, and are diagnosed in over 500,000 patients worldwide each year, accounting for 5% of all malignancies. In the past several years, there have been significant developments in understanding of HNC. It is now recognized that although alcohol and tobacco use has represented the likely predominant cause of SCCHN, the incidence of a second class of SCCHN related to oncogenic human papillomavirus (HPV) infection is increasing, with a four-fold increase in the past 2 decades, and now thought to represent up to 30% of cases. The first effective target for SCCHN, the EGFR-targeting antibody cetuximab, was approved as recently as in 2006; since then, a growing body of research has identified additional signaling pathways as important in disease pathogenesis, and in resistance to treatment. Proteins such as c-Met, Src, and HER2 are emerging as new therapeutic targets, with a considerable ferment in the clinical trial community. As a capstone of research progress, 2011 marked the first reports of high throughput sequencing of SCCHN tumors, with these efforts identifying unexpected players such as Notch as frequent subject of mutation, spawning new hypotheses for future research. This book will be of interest to researchers who are interested in better understanding the biology of head and neck cancers, with the goals of better designing therapies, identifying risk factors, or investigating the molecular basis of the disease. *Diagnostic Molecular Pathology: A Guide to Applied Molecular Testing* is organized around disease types (genetic disease, infectious disease, neoplastic disease, among others). In each section, the authors provide background on disease mechanisms and describe how laboratory testing is built on knowledge of these mechanisms. Sections are dedicated to general methodologies employed in testing (to convey the concepts reflected in the methods), and specific description of how these methods can be applied and are applied to specific diseases are described. The book does not present molecular methods in isolation, but considers how other evidence (symptoms, radiology or other imaging, or other clinical tests) is used to guide the selection of molecular tests or how these other data are used in conjunction with molecular tests to make diagnoses (or otherwise contribute to clinical workup). In addition, final chapters look to the future (new technologies, new approaches) of applied molecular pathology and how discovery-based research will yield new and useful biomarkers and tests. *Diagnostic Molecular Pathology: A Guide to Applied Molecular Testing* contains exercises to test readers on their understanding of how molecular diagnostic tests are utilized and the value of the information that can be obtained in the context of the patient

workup. Readers are directed to an ancillary website that contains supplementary materials in the form of exercises where decision trees can be employed to simulate actual clinical decisions. Focuses on the menu of molecular diagnostic tests available in modern molecular pathology or clinical laboratories that can be applied to disease detection, diagnosis, and classification in the clinical workup of a patient Explains how molecular tests are utilized to guide the treatment of patients in personalized medicine (guided therapies) and for prognostication of disease Features an ancillary website with self-testing exercises where decision trees can be employed to simulate actual clinical decisions Highlights new technologies and approaches of applied molecular pathology and how discovery-based research will yield new and useful biomarkers and tests
