**The Effect of Age in the Alteration in Fluid Balance of Rats in Response to Centrifugation** Feb 22 2022 With an increase in gravity load induced by centrifugation or upon return to Earth following spaceflight, there is a period of adjustment in fluid balance in rats. With centrifugation there is a reduced fluid intake with maintenance of the rate of urine excretion. Following spaceflight there is an increase in urine output and maintenance of fluid intake. The initial period of acclimation to hypergravity is associated with a net loss of fluids. In the present study in response to centrifugation at 2.0 G this period of acclimation is present in mature rats for a longer period of time, about 24 hours. Following this initial response a period of over compensation has previously been reported. In the present study this was not observed. The net effect of these alterations in water intake and output in response to centrifugation for 14 days was slight increase in the percent total body water, with effective compensation seen in both young and mature rats. Older rats have been shown to have a reduced relative thirst and compensatory renal function in response to hypohydration, hyperosmolality and pharmacological stimuli. Responsiveness to these stimuli are delayed and/or attenuated in older animals. Similar findings were noted in the present study in the initial response to centrifugation. The older animal had a delayed return of fluid intake to control levels. The delay of one day did not appear to effect long-term fluid homeostasis, as there was difference in the response of percent total body water at the end of 14 days of centrifugation with both age groups having a slight but significant increase. This increase has been attributed to the increase in lean body mass induced by centrifugation. Fuller, Charles A. Ames Research Center

Understanding Language Teaching May 04 2020 This book traces the historical development of major language teaching methods in terms of theoretical principles and classroom procedures, and provides a critical evaluation of each. Drawing from seminal, foundational texts and from critical commentaries made by various scholars, Kumaravadivelu examines the profession's current transition from method to postmethod and, in the process, elucidates the relationship between theory, research, and practice. The chief objective is to help readers see the pattern that connects language, learning, teaching methods, and postmethod perspectives. In this book, Kumaravadivelu: \*brings together a critical vision of L2 learning and teaching--a vision founded at once on historical development and contemporary thought; \*connects findings of up-to-date research in L2 learning with issues in L2 teaching thus making the reader aware of the relationship between theory, research and practice; \*presents language teaching methods within a coherent framework of language-, learner-, and learning-centered pedagogies, thus helping the reader to see how they are related to each other; \*shows how the three categories of methods evolved historically leading ultimately (and inevitably) to the emergence of a postmethod condition; and \*provides the reader with a solid background in several interconnected areas of L2 pedagogy, such as concepts of competence, input factors, intake processes, interactional modifications, and instructional design. Understanding Language Teaching: From Method to Postmethod is intended for an international audience of teacher educators, practicing teachers and graduate students, researchers, curriculum planners, and materials designers in the field of second and foreign language teaching.

Fragility Fracture Nursing May 16 2021 This open access book aims to provide a comprehensive but practical overview of the knowledge required for the assessment and management of the older adult with or at risk of fragility fracture. It considers this from the perspectives of all of the settings in which this group of patients receive nursing care. Globally, a fragility fracture is estimated to occur every 3 seconds. This amounts to 25 000 fractures per day or 9 million per year. The financial costs are reported to be: 32 billion EUR per year in Europe and 20 billion USD in the United States. As the population of China ages, the cost of hip fracture care there is likely to reach 1.25 billion USD by 2020 and 265 billion by 2050 (International Osteoporosis Foundation 2016). Consequently, the need for nursing for patients with fragility fracture across the world is immense. Fragility fracture is one of the foremost challenges for health care providers, and the impact of each one of those expected 9 million hip fractures is significant pain, disability, reduced quality of life, loss of independence and decreased life expectancy. There is a need for coordinated, multi-disciplinary models of care for secondary fracture prevention based on the increasing evidence that such models make a difference. There is also a need to promote and facilitate high quality, evidence-based effective care to those who suffer a fragility fracture with a focus on the best outcomes for recovery, rehabilitation and secondary prevention of further fracture. The care community has to understand better the experience of fragility fracture from the perspective of the patient so that direct improvements in care can be based on the perspectives of the users. This book supports these needs by providing a comprehensive approach to nursing practice in fragility fracture care.
