The 99 points of intersection presented here were collected during a year-long search for surprising concurrence of lines. For each example we find compelling evidence for the sometimes startling fact that in a geometric figure three straight lines, or sometimes circles, pass through one and the same point. Of course, we are familiar with some examples of this from basic elementary geometry - the intersection of medians, altitudes, angle bisectors, and perpendicular bisectors of sides of a triangle. Here there are many more examples - some for figures other than triangles, some where even more than three straight lines pass through a common point. The main part of the book presents 99 points of intersection purely visually, developed in a sequence of figures. In addition the book contains general thoughts on and examples of the points of intersection, as well as some typical methods of proving their existence. Major survey offers comprehensive, coherent discussions of analytic geometry, algebra, differential equations, calculus of variations, functions of a complex variable, prime numbers, linear and non-Euclidean geometry, topology, functional analysis, more. 1963 edition. A unique and thorough indexing system, with indices appearing in each volume, provides readers with quick and easy access to treaties. We propose the Point Beauty Contest, a mechanism to identify the distribution of focal points on the individual level. By

contrast to conventional coordination, subjects coordinate by the distribution of points. This allows for nuanced coordination strategies, as subjects can invest in multiple alternatives at the same time and weigh their choice. A subject's strategy choice then reveals her perception of the distribution of focal points. In an experiment on the elicitation of social norms, we compare the mechanism with conventional coordination. The data confirms the theoretical predictions regarding coordination behavior and demonstrates that the proposed technique is suited to identify the distribution of focal points on the individual level. Using Monte Carlo simulations, we find that the proposed mechanism identifies focal points on the population level more efficiently than conventional coordination. We point to the possibility of using the mechanism as a simple method to directly measure strategic uncertainty. Excerpt from The Safe Compass, and How It Points What a curious thing a compass is! How strangely the little needle trembles on the point of the piece of wire which supports it! How wonderful it is to see that needle always pointing to the North! Who can explain how it is that it always does so? God made it to be always pointing in one direction, and it does just what he wants it to do. This is all we know about it. If you ask a learned man what it is which makes the needle of the compass always point to the North, he will tell you it is magnetism. But, if you ask him what magnetism is, or how it produces this effect upon the needle, he can not tell you. Nobody can explain this. But the compass is not the less useful because none can explain the way in which the needle acts. The compass is one of the most useful things we have. The sailor never could find his way over the sea without 'it. And those who have to travel over great deserts, or through countries in which there are no roads, always need a compass, to show them the direction in which they should go.
