In financial and actuarial modeling and other areas of application, stochastic differential equations with jumps have been employed to describe the dynamics of various state variables. The numerical solution of such equations is more complex than that of those only driven by Wiener processes, described in Kloeden & Platen: Numerical Solution of Stochastic Differential Equations (1992). The present monograph builds on the above-mentioned work and provides an introduction to stochastic differential equations with

jumps, in both theory and application, emphasizing the numerical methods needed to solve such equations. It presents many new results on higher-order methods for scenario and Monte Carlo simulation, including implicit, predictor corrector, extrapolation, Markov chain and variance reduction methods, stressing the importance of their numerical stability. Furthermore, it includes chapters on exact simulation, estimation and filtering. Besides serving as a basic text on quantitative methods, it offers ready access to a large number of potential research problems in an area that is widely applicable and rapidly expanding. Finance is chosen as the area of application because much of the recent research on stochastic numerical methods has been driven by challenges in quantitative finance. Moreover, the volume introduces readers to the modern benchmark approach that provides a general framework for modeling in finance and insurance beyond the standard risk-neutral approach. It requires undergraduate background in mathematical or quantitative methods, is accessible to a broad readership, including those who are only seeking numerical recipes, and includes exercises that help the reader develop a deeper understanding of the underlying mathematics. This book delves into the many innovative changes that the financial industry has undergone in recent years. The authors investigate these developments in a holistic manner and

from a wide range of perspectives: both public and private, business and consumer, regulators and supervisors. Initially, they set the framework of their analysis by discussing innovation cycles in financial services. Thereafter, they tackle the issue of financial innovations and their consequences for financial stability. They then review the new approaches to financial consumers' protection, which emerged in the aftermath of the global financial crisis. The authors underline the fact that this new approach is heavily influenced by the recent innovative drive in the financial industry. Next, they switch their attention to the public sector, examining the innovative processes in monetary policy and central banks, structural innovations in the supervisory models and systems, and they assess some specific supervisory challenges regarding blockchain and the application of mathematics in the supervisory capacity. Additionally, the book examines a range of issues related to the private sector, such as recent developments regarding risk transferring mechanisms on the financial market, artificial intelligence and natural language processing for regulatory filings, the development of process management in insurance companies and other innovative products on the market. Finally, Innovation in Financial Services discusses how the digital transformation of the financial system impacts the interaction between the public and private sectors. The book is intended for graduate and postgraduate level students, researchers, public sector officers, as well as financial sector practitioners. Following the success of the first edition that brought attention to the digital revolution in Islamic financial services, comes this revised and updated second edition of Blockchain, Fintech and Islamic Finance. The authors reiterate the potential of digital disruption to shrink the role and relevance of today's banks, while simultaneously creating better, faster, cheaper services that will be an essential part

of everyday life. Digital transformation will also offer the ability to create new ways to better comply to Islamic values in order to rebuild trust and confidence in the current financial system. In this new edition, they explore current concepts of decentralized finance (DeFi), distributed intelligence, stablecoins, and the integration of AI, blockchain, data analytics and IoT devices for a holistic solution to ensure technology adoption in a prudent and sustainable manner. The book discusses crucial innovation, structural and institutional developments for financial technologies including two fast-growing trends that merge and complement each other: tokenization, where all illiquid assets in the world, from private equity to real estate and luxury goods, become liquid and can be traded more efficiently, and second, the rise of a new tokenized economy where inevitably new rules and ways to enforce them will develop to fully unleash their capabilities. These complementary and oft-correlated trends will complete the decentralization of finance and will influence the way future financial services will be implemented. This book provides insights into the shift in processes, as well as the challenges that need to be overcome for practical applications for AI and blockchain and how to approach such innovations. It also covers new technological risks that are the consequence of utilizing frontier technologies such as AI, blockchain and IoT. Industry leaders, Islamic finance professionals, along with students and academics in the fields of Islamic finance and economics will benefit immensely from this book.
