This book groups together recent studies of some of the most significant features of contemporary public international law. It straddles some five differing aspects of the living law of the United Nations. Although written on diverse occasions and for different purposes, they are nevertheless animated by the common ideal of analysing and synthesising current issues with which the International Court of Justice, the United Nations Organization itself and related law-making organs and institutions have been grappling in the last five years or so. The treatment of the subjects with which they deal and the manner of their orientation naturally differ both in scope and in depth of analysing, depending upon the particular aspects of international law under consideration. They open up not only new horizons but also, as one of its chapters indicates, new conceptions and perspectives in current international law. Old topics are re-examined from new angles, some new topics are studied in such a way as to relate them to their customary roots and pristine significance in legal thought. There are five main parts. The first and inevitably the longest division deals with the international judicial process in nearly all its modern ramifications as exemplified in the work of the Court. The first study deals with problems of method associated with the internal judicial practice of the Court from the moment the public hearings have been completed up to the delivery of the judgment; in other words, how the Court judges a case. The Hague Agreement is an international registration system which offers the possibility of obtaining protection for industrial designs in a number of States and/or intergovernmental organizations by means of a single international application filed with the International Bureau of the World Intellectual Property Organization (WIPO). Real estate activity across national boundaries (investment, development and asset management) is firmly established as a major component of global economic activity. *International Real Estate* provides the understanding of real estate strategies and transactions that cross national boundaries. International organizations lament the narrow perspective of professionals in the real estate field, which stems from training that takes a parochial rather than international view of the practices and processes of real estate markets. This book takes an explicitly international perspective to the decision-making process leading to final 'accept' or 'reject' investment decisions. It will be the first to adopt an institutional approach that directly addresses the problems of how to identify and avoid the main pitfalls of cross-border investment in real estate. The key to understanding international real estate comes from understanding the impact on investment and management decisions of differences in the formal and informal 'rules of the game'. The authors define the key feature of international real estate as the institutions that frame, facilitate or impede investment in land and buildings across national boundaries. As part of a long-standing collaboration on nuclear nonproliferation, the National Academy of Sciences and the Russian Academy of Sciences held a joint workshop in Moscow in 2003 on the scientific aspects of an international radioactive disposal site in Russia. The passage of Russian laws permitting the importation and storage of high-level radioactive material (primarily spent nuclear fuel from reactors) has engendered interest from a number of foreign governments, including the U.S., in exploring the possibility of transferring material to Russia on a temporary or permanent basis. The workshop focused on the environmental aspects of the general location and characteristics of a possible storage site, transportation to and within the site, containers for transportation and storage, inventory and accountability, audits and inspections, and handling technologies. In The Community of Interest Approach in International Water Law, Julie Gjörtz Howden identifies the normative elements of the community of interest approach, and how the approach provides a legal framework for common management of international watercourses. Social, economic, political, business, and cultural environmental factors affect the international marketing operation and performance of international firms. This highly insightful volume focuses on four of the most significant forces with which companies must deal on an international level--macro international marketing issues, sociopolitical international marketing issues, international marketing strategies, and special international marketing topics. Within this framework, experts examine the impact of two major environmental factors, namely the social and political conditions, on international companies to adopt corresponding marketing techniques and practices in different international markets. They also explore how specific details of a country, such as income level, cultural attributes, consumer characteristics, laws, and politics, influence the market potential of international firms and thus the scale of the company operations. Indispensable reading for scholars, economists, and business people who are interested in marketing on a global scale.

Arts Features International, January-March 2019, Under the Radar issue, edited by Ruth Skilbeck, features works by Chris Wallace-Crabbe, Richard James Allen, Kristin Headlam, Georgia Wallace-Crabbe, Karen Pearlman, Michael Gormly, Vee Malnar, Tom Bierdz, Gregory Miller, and Behrouz Boochani, with art works by Arthur Boyd, Andrew Doyle and Ma Yuan. As computer power grows and data collection technologies advance, a plethora of data is generated in almost every field where computers are used. The computer generated data should be analyzed by computers; without the aid of computing technologies, it is certain that huge amounts of data collected will not ever be examined, let alone be used to our advantages. Even with today's advanced computer technologies (e. g. , machine learning and data mining systems), discovering knowledge from data can still be fiendishly hard due to the characteristics of the computer generated data. Taking its simplest form, raw data are represented in feature-values. The size of a dataset can be measured in two dimensions, number of features (N) and number of instances (P). Both N and P can be enormously large. This enormity may cause serious problems to many data mining systems. Feature selection is one of the long existing methods that deal with these problems. Its objective is to select a minimal subset of features according to some reasonable criteria so that the original task can be achieved equally well, if not better. By choosing a minimal subset of features, irrelevant and redundant features are removed according to the criterion. When N is reduced, the data space shrinks and in a sense, the data set is now a better representative of the whole data population. If necessary, the reduction of N can also give rise to the reduction of P

by eliminating duplicates. This text provides an in-depth examination of the international aspects of succession, utilizing not merely English cases and materials, but also materials from other common law jurisdictions, particularly from common law jurisdictions such as Australia, Canada and New Zealand. The book also features American material and aims to bridge the gap between academic and practitioner texts. Verbeke provides a new perspective on international business strategy by combining analytical rigour and true managerial insight on the functioning of large multinational enterprises (MNEs). With unique commentary on 48 seminal articles published in the Harvard Business Review, the Sloan Management Review and the California Management Review over the past three decades, Verbeke shows how these can be applied to real businesses engaged in international expansion programmes, especially as they venture into high-distance markets. The second edition has been thoroughly updated and features greater coverage of emerging markets with a new chapter and seven new cases. Suited for advanced undergraduates and graduate courses, students will benefit from updated case studies and improved learning features, including 'management takeaways', key lessons that can be applied to MNEs and a wide range of online resources. With the considerable advances made in the quality of sensors on board commercial observation satellites, information gained from them not only became widely available, but very useful for the verification of a number of arms control treaties including the Treaty on the Non-Proliferation of Nuclear Weapons (the NPT). Satellites have begun to play an important role in the safeguards procedures under the NPT. For example, from satellites, nuclear facilities and activities such as the construction and shapes of buildings (including underground activities), plant expansion, and changes in operational status can be monitored. For an effective use of satellite imagery, it is important to determine identifiable signatures related to nuclear facilities that could be used in the interpretation and verification of activities. The book presents studies on visual and computer-based interpretation of remote sensing data for international safeguards purposes. Within development economics, there has always been a tendency to draw a distinction between the domestic and international aspects of the subject, with many economists arguing that the domestic context is of much greater interest than the international arena in which it exists. This is an extreme view which ignores the complex interplay between the internal and external environments. International Aspects of Economic Development examines important aspects of economic development--debt, energy, environment, industrialization, trade, and aid--and shows that these are problems that cannot be viewed solely from one country's perspective, but must be viewed as part of an international system to gain the greatest understanding. Key Features \* Written by well known international economists \* Discusses all aspects of economic development During the COVID-19 pandemic, unprecedented national authority seems the motto of the day, and international authority largely irrelevant. By contrast, the article will show that international authority does play a core role in the global response, and that some governments, by failing to see this, may even be facilitating shifts in the multilateral world order. To this end, the article will first present some essentials to grasp the WHO's authority, an embattled instance of global governance. It then analyzes three key contributions to the current pandemic response with the respective controversies: Its detailed regulatory framework, its framing of the 2020 health crisis, including its much criticized postponement for a week, and its recommendations on what to do concretely, in particular not to restrict travel which is accused of hindering national governments. The article then moves to two broader questions. The first is how the WHO's positioning in the clash between more democratic and more authoritarian forces, as it emerges in its recommendations on how to square human rights with quarantines. The second issue relates to its positioning in the current competition between China and the West, in particular the US. International Series of Monographs in Natural Philosophy, Volume 32: Random Functions and Turbulence focuses on the use of random functions as mathematical methods. The manuscript first offers information on the elements of the theory of random functions. Topics include determination of statistical moments by characteristic functions; functional transformations of random variables; multidimensional random variables with spherical symmetry; and random variables and distribution functions. The book then discusses random processes and random fields, including stationarity and ergodicity of random processes; influence of finiteness of the interval of averaging; scalar and vector random fields; and statistical moments. The text takes a look at the statistical theory of turbulence. Topics include turbulence with very large Reynolds numbers; emergence of turbulent motion; and energy spectrum in isothermal turbulent shear flow. The book also discusses small-scale and large-scale atmospheric turbulence and applications to numerical weather analysis and prediction. The manuscript is a vital source of data for readers interested in random theory.
