This book discusses biomethane and the processes and applications downstream from biogas production. Biogas is a result of anaerobic digestion of agricultural or general household waste, such as manure, plants or food waste, and as such is considered a renewable energy source. Biomethane is a gas that results from any process that improves the quality of biogas by reducing the levels of carbon dioxide, hydrogen sulfide, moisture and other contaminant gases. Chemically, biomethane is the same as methane, and its name refers to the method of production rather than the content. Biomethane plants are generally found in locations with a low population density that are close to farms or food processing plants. In situations where there is no natural gas pipeline nearby, biomethane downstream applications can include storage, transportation, home heating, industrial use and distribution through small-scale local gas grids. This book discusses each of these applications and lists some of the design criteria as well as various issues relating to them. The definitive text/reference for students, researchers and practicing engineers This book provides comprehensive coverage on refrigeration systems and applications, ranging from the fundamental principles of thermodynamics to food cooling applications for a wide range of sectoral utilizations. Energy and exergy analyses as well as performance assessments through energy and exergy efficiencies and energetic and exergetic coefficients of performance are explored, and numerous analysis techniques, models, correlations and procedures are introduced with examples and case studies. There are specific sections allocated to environmental impact assessment and sustainable development studies. Also featured are discussions of important recent developments in the field, including those stemming from the author's pioneering research. Refrigeration is a uniquely positioned multi-disciplinary field encompassing mechanical, chemical, industrial and food engineering, as well as chemistry. Its wide-ranging applications mean that the industry plays a key role in national and international economies. This accessible book presents unconventional technologies in heat exchanger design that have the capacity to provide solutions to major concerns within the process and power-generating industries. Demonstrating the advantages and limits of these innovative heat exchangers, it also discusses micro- and nanostructure surfaces and micro-scale equipment, and introduces pillow-plate, helical and expanded metal baffle concepts. It offers step-by-step worked examples, which provide instructions for developing an initial configuration and are supported by clear, detailed drawings and pictures. Various types of heat exchangers are available, and they are widely used in all fields of industry for cooling or heating purposes, including in combustion engines. The market in 2012 was estimated to be US\$ 42.7 billion and the global demand for heat exchangers is experiencing an annual growth of about 7.8 %. The market value is expected to reach US\$ 57.9 billion in 2016, and approach US\$ 78.16 billion in 2020. Providing a valuable introduction to students and researchers, this book offers clear and concise information to thermal engineers, mechanical engineers, process engineers and heat exchanger specialists. Heat transfer enhancement has seen rapid development and widespread use in both conventional and emerging technologies. The code is based on the residential heat pump model developed at Oak Ridge National Laboratory. Most calculations are based on fundamental physical principles, in conjunction with generalized correlations available in the research literature. Automobile air conditioning components that can be specified as inputs to the program include open and hermetic compressors; finned tube condensers; finned tube and plate-fin style evaporators; thermal expansion valve, capillary tube and short tube expansion devices; refrigerant mass; evaporator pressure regulator; and all interconnecting tubing. The program can be used with a variety of refrigerants, including R134a. Methodologies are discussed for using the model as a tool for designing all new systems or, alternatively, as a tool for simulating a known system for a variety of operating conditions. The World Banana Forum (WBF) publication developed a methodological guide to reduce water and carbon footprints in banana plantations worldwide. Members of the Working Group (WG) on Sustainable Production Systems and Environmental Impact acknowledged the contribution of banana production in the total global GHG emissions and the consumption of freshwater in the economic activity, both stressed in the 2015 Paris Climate Conference (COP21), having the agricultural sector a high mitigation potential. Therefore, the WG wishes to contribute to the global fight against climate change and promote the sustainable use of natural resources, developing practical tools to strengthen the efforts of the global banana industry to reduce its carbon and water footprint (CWF). Since banana farmers are struggling to adapt to climate change, the project aims to mainstream and support the adoption of best climate-smart practices and efficient water management in the banana value chain as part of the environmental strategy of organizations. Efforts to promote CWF reduction programs in the banana industry are still incipient and carried out mostly by multinationals, due in part to the implementation costs, the complexity of the topic for farmers, the lack of user-friendly tools to measure them efficiently, and that is still a B2B-driven strategy not yet recognized by consumers. Even though the need for supporting carbon and water footprint analysis (CWF) in the banana industry remains strong, there is still an apparent lack of sufficient financial incentives by both the governments and the global market. Do you want to know tips, secrets, and handy hints to achieve the best deals for yourself? Drought, forest fires, and melting ice caps: the climate crisis is an existential threat to human life on Earth. The Paris Climate Agreement shows that the actions of governments alone will not be enough to prevent a climate catastrophe. For Ferry Heilemann, digital entrepreneur and founder of the Leaders for Climate Action initiative, one thing is therefore very clear: businesspeople need to do their bit to contribute towards global climate protection. How can a business measure its own carbon footprint? How can CO2 emissions be reduced in the shortest time possible? What specific steps are required to achieve this? And how can effective alliances be built up between businesses and their surroundings? With the aid of precise checklists, recommendations for practical action, and background knowledge, the Climate Action Guide shows how businesses can implement straightforward measures and make an important contribution to the protection of our planet – in the process also making themselves future-proof. The first action guide for businesses which want to take practical action to protect the climate.
