A moody mystery set in Italy from the New York Times–bestselling author: “One of the most exquisite and subtle detective series ever.” –The Washington Post Guido Brunetti has to deal every day with crimes big and small, suffocating corruption, and a never–ending influx of tourists. But at least he gets to do it in Venice, one of the most beautiful cities in the world. In this mystery in the bestselling series, the police commissioner’s endurance will truly be tested. During an interrogation of an entitled, arrogant man suspected of giving drugs to a young girl, Brunetti acts rashly, doing something he will quickly come to regret. In the fallout, he realizes that he needs a break. Granted leave from the Questura, he accompanies his wife to a villa on Sant’Erasmus, one of the largest islands in the laguna. There he intends to pass his days rowing, and his nights reading Pliny’s Natural History. That is until the caretaker of the house, a widowed beekeeper, goes missing following a sudden storm, and Brunetti must set aside his leave of absence and understand what happened to a man who had become a friend. From a Silver Dagger Award–winning author, this is a poignant novel featuring Guido Brunetti, “a superb

police detective—calm, deliberate, and insightful” (Library Journal). A journal of statistics emphasizing the statistical study of biological problems. Papers contain original theoretical contributions of direct or potential value in applications. Introduction to Hydrometeorology is the study of the hydrologic cycle, which is the circulation of water from the seas, into the atmosphere, and back to either land or sea. This book describes hydrometeorology or the application of meteorology to problems that pertain to hydrology, and then discusses the approach, through meteorology, to the solution of hydrologic problems. This text outlines observation methods on the subject and discusses the applications of hydrometeorology to problems encountered in the study of river and lake behaviors. Topics include precipitation, melting of ice, streamflows, lakes, evaporation, and evapotranspiration. The frequently used methods in analysis, such as employing statistics to hydrometeorological problems, precipitation analysis, and streamflow routing are explained. This text also shows how extending streamflow records can be helpful in predicting the regime or course of a stream in the future. Records of seasonal and annual flow, flood runoff, peak discharge, as well as seasons of low flow and drought become useful tools in estimating the frequency and magnitude of streamflows. After which, the book discusses possible engineering designs in irrigation, storm sewers, and reservoirs. The text looks into the ways how human has influenced the hydrologic cycle through induced precipitation, melting of ice covers, and urbanization. Lastly,

some climactic trends and cycles that bring about climate change and water resource development are discussed. This text can be used by students studying hydrology and those with meteorology majors. This book can also be read by meteorologists, environmentalists, and people working in general earth sciences. Summary of available data and explanation of techniques and criteria used in appraising the water resources of the Upper Colorado River Basin. Very Good, No Highlights or Markup, all pages are intact. Vols. 29-30 contain papers of the International Engineering Congress, Chicago, 1893; v. 54, pts. A-F, papers of the International Engineering Congress, St. Louis, 1904. Containing over one hundred and sixty line drawings, maps and one hundred tables, this book explains the fundamental hydrologic principles and favoured methods of analysis. Aimed at students interested in natural resources and environmental science, spreadsheet exercises and worked examples help to develop basic problem solving skills.
