Lectures on the criticism and interpretation of the Bible, with two preliminary lectures on theological study and theological arrangement. To which are now added, two lectures on the history of biblical interpretation Dec 28 2022

Riemannian Geometry During the Second Half of the Twentieth Century Apr 27 2020

During its first hundred years, Riemannian geometry enjoyed steady, but undistinguished growth as a field of mathematics. In the last fifty years of the twentieth century, however, it has exploded with activity. Berger marks the start of this period with Rauch's pioneering paper of 1951, which contains the first real pinching theorem and an amazing leap in the depth of the

connection between geometry and topology. Since then, the field has become so rich that it is almost impossible for the uninitiated to find their way through it. Textbooks on the subject invariably must choose a particular approach, thus narrowing the path. In this book, Berger provides a remarkable survey of the main developments in Riemannian geometry in the second half of the last fifty years. One of the most powerful features of Riemannian manifolds is that they have invariants of (at least) three different kinds. There are the geometric invariants: topology, the metric, various notions of curvature, and relationships among these. There are analytic invariants: eigenvalues of the

Laplacian, wave equations, Schrödinger equations. There are the invariants that come from Hamiltonian mechanics: geodesic flow, ergodic properties, periodic geodesics. Finally, there are important results relating different types of invariants. To keep the size of this survey manageable, Berger focuses on five areas of Riemannian geometry: Curvature and topology; the construction of and the classification of space forms; distinguished metrics, especially Einstein metrics; eigenvalues and eigenfunctions of the Laplacian; the study of periodic geodesics and the geodesic flow. Other topics are treated in less detail in a separate section. While Berger's survey is not intended for the complete beginner (one should already be familiar with notions of curvature and geodesics), he provides a detailed map to the major developments of Riemannian geometry from 1950 to 1999. Important threads are highlighted, with brief descriptions of the results that make up that thread. This supremely

digitaltutorials.jrn.columbia.edu

scholarly account is remarkable for its careful citations and voluminous bibliography. If you wish to learn about the results that have defined Riemannian geometry in the last half century, start with this book.

An Introduction to Hegel's Lectures on the Philosophy of Religion May 28 2020

"It provides an account of the criticism of religion by key Enlightenment thinkers such as Voltaire, Lessing, Hume, and Kant. This is followed by an analysis of how the Romantic thinkers, such as Rousseau, Jacobi, and Schleiermacher, responded to these challenges. For Hegel, the views of these thinkers from both the Enlightenment and Romanticism tended to empty religion of its content. The goal that he sets for his own philosophy of religion is to restore this lost content. " -- back cover.

Lectures on Numerical Mathematics Sep 24 2022 The present book is an edition of the manuscripts to the courses "Numerical Methods I" and "Numerical Mathematics I and II" which

Professor H. Rutishauser held at the E.T.H. in Zurich. The first-named course was newly conceived in the spring semester of 1970, and intended for beginners, while the two others were given repeatedly as elective courses in the sixties. For an understanding of most chapters the fundamentals of linear algebra and calculus suffice. In some places a little complex variable theory is used in addition. However, the reader can get by without any knowledge of functional analysis. The first seven chapters discuss the direct solution of systems of linear equations, the solution of nonlinear systems, least squares problems, interpolation by polynomials, numerical quadrature, and approximation by Chebyshev series and by Remez' algorithm. The remaining chapters include the treatment of ordinary and partial differential equations, the iterative solution of linear equations, and a discussion of eigen value problems. In addition, there is an appendix dealing with the qd algorithm and with an axiomatic treatment of

digitaltutorials.jrn.columbia.edu

computer arithmetic.

Allegory Old and New Mar 26 2020 Bringing allegory into the light from the neglect into which it fell means focusing on the wondrous heights of the human spirit in its significance for culture. Contemporary philosophies and literary theories, which give pre-eminence to primary linguistics forms (symbol and metaphor), seem to favor just that which makes intelligible communication possible. But they fall short in accounting for the deepest subliminal founts that prompt the mind to exalt in beauty, virtue, transcending aspiration. The present, rich collection shows how allegory, incorporating the soaring of the spirit, offers highlights for culture, with its fluctuations and transformation. This collective effort, rich in ideas and intuitions and covering a vast range of cultural manifestations, is a pioneering work, retrieving the vision of the exalted human spirit, bringing together literature, theatre, music and painting in a variety of revealing perspectives. The authors

include: M. Kronegger, Ch. Raffini, J. Smith, J.B. Williamson, H. Ross, M.F. Wagner, F. Divorne, L. Oppenheim, D.K. Heckerl, N. Campi de Castro, P. Saurez Pascual, M. Alfaro Amieiro, H. Fletcher Thompson, R.J. Wilson III, and A. Stensaas. For specialists, students and workers in philosophy, comparative literature, aesthetic phenomenologists and historians of art.

Essays in Post-Critical Philosophy of Technology
Jun 29 2020 Technology, in all its forms, has had and continues to have an indisputable impact on society and culture. Philosophy of technology seeks to understand this impact and the meaning of technology for society and culture. Although its origins can be traced back to the Greeks, it wasn't until the late 19th century to

the beginning of the 20th century that it gained ground as a philosophical discipline. Now more than ever it is considered an essential philosophical enterprise. 'The Budapest Workshop on Philosophy of Technology' was a lively and successful event that sought to discuss, reflect on and apply this branch of philosophical inquiry to both historical and contemporary examples. Importantly, the contributors' methodological approaches were influenced by, although not limited to, Michael Polanyi's term 'post-critical'. Moving beyond the rigidity of past approaches, the selected essays were driven by two lines of inquiry, what has been the historical role of technology in social and scientific change? And, how can a 'post-critical' approach enhance and extend our understanding of philosophy of technology? This edited volume begins by exploring the role of technology in social and scientific developments from a historical perspective, before moving towards a discussion of philosophy of technology

from a 'Post-Critical' epistemic stance. Free from the constraints of previous methodologies, the third part of this work engages with the term 'Post-Critical' in its broadest sense. The contributors to this section consider the phenomenology of the body and the influence of technology on our lives. Finally, the four concluding chapters of this book apply this philosophical approach to a wide range of contemporary problems from Decision Support Systems to Crisis Communication.

Lectures on the Principal Doctrines and Practices of the Catholic Church May 09 2021
[The History of Scottish Theology, Volume II](#) Aug 12 2021
This three-volume work comprises over eighty essays surveying the history of Scottish theology from the early middle ages onwards. Written by an international team of scholars, the collection provides the most comprehensive review yet of the theological movements, figures, and themes that have shaped Scottish culture and exercised a significant influence in other parts of the world. Attention is given to different traditions and to the dispersion of Scottish theology through exile, migration, and missionary activity. The volumes present in diachronic perspective the theologies that have flourished in Scotland from early monasticism until the end of the twentieth century. The History of Scottish Theology, Volume I covers

the period from the appearance of Christianity around the time of Columba to the era of Reformed Orthodoxy in the seventeenth century. Volume II begins with the early Enlightenment and concludes in late Victorian Scotland. Volume III explores the 'long twentieth century'. Recurrent themes and challenges are assessed, but also new currents and theological movements that arose through Renaissance humanism, Reformation teaching, federal theology, the Scottish Enlightenment, evangelicalism, missionary, Biblical criticism, idealist philosophy, dialectical theology, and existentialism. Chapters also consider the Scots Catholic colleges in Europe, Gaelic women writers, philosophical scepticism, the dialogue with science, and the reception of theology in liturgy, hymnody, art, literature, architecture, and stained glass. Contributors also discuss the treatment of theological themes in Scottish literature.

Church ... Third edition Feb 03 2021
Pro Mundo - Pro Domo Dec 24 2019 Pro Mundo - Pro Domo: The Writings of Alban Berg contains new English translations of the complete writings of the Viennese composer Alban Berg (1885-1935) and extensive commentaries tracing the history of each essay and its connection to musical culture of the early twentieth century. Berg is now recognized as a classic composer of the modern period, best known for his operas *Wozzeck* and *Lulu*. Berg, Anton Webern, and their teacher Arnold Schoenberg constitute the "Second Viennese School," which played a major role in the transformation of serious music as it entered the modern period. Berg was an avid and skillful writer. His essays include analytic studies of compositions by Schoenberg, polemics on music and musicians of his day, and lectures and miscellaneous writings on a variety of topics. Throughout his considerable and diverse corpus of writings, Berg alternates between two

perspectives: Pro Mundo - Pro Domo, meaning roughly "speaking for all - speaking for myself," commenting at one moment on the general state of culture and the world, and the next moment on his own works. In his early years he also tried his hand at fictional writing, using works by Ibsen and Strindberg as models. This new English edition contains 47 essays, many of which are little known and have not been previously available in English.

The Last Lecture Jan 29 2023 "We cannot change the cards we are dealt, just how we play

the hand."---Randy Pausch A lot of professors give talks titled "The Last Lecture." Professors are asked to consider their demise and to ruminate on what matters most to them. And while they speak, audiences can't help but mull the same question: What wisdom would we impart to the world if we knew it was our last chance? If we had to vanish tomorrow, what would we want as our legacy? When Randy Pausch, a computer science professor at Carnegie Mellon, was asked to give such a lecture, he didn't have to imagine it as his last, since he had recently been diagnosed with terminal cancer. But the lecture he gave--"Really Achieving Your Childhood Dreams"--wasn't about dying. It was about the importance of overcoming obstacles, of enabling the dreams of others, of seizing every moment (because "time is all you have...and you may find one day that you have less than you think"). It was a summation of everything Randy had come to believe. It was about living. In this book, Randy

Pausch has combined the humor, inspiration and intelligence that made his lecture such a phenomenon and given it an indelible form. It is a book that will be shared for generations to come.

Lectures on the Asymptotic Theory of Ideals Oct 26 2022 In this book Professor Rees introduces and proves some of the main results of the asymptotic theory of ideals. The author's aim is to prove his Valuation Theorem, Strong Valuation Theorem, and Degree Formula, and to develop their consequences. The last part of the book is devoted to mixed multiplicities. Here the author develops his theory of general elements of ideals and gives a proof of a generalised degree formula. The reader is assumed to be familiar with basic commutative algebra, as covered in the standard texts, but the presentation is suitable for advanced graduate students. The work is an expansion of lectures given at Nagoya University.

[The 1903 Lowell Lectures](#) May 21 2022 In three

comprehensive volumes, *Logic of the Future* presents a full panorama of Charles S. Peirce's important late writings. Among the most influential American thinkers, Peirce took his existential graphs to be his greatest contribution to human thought. The manuscripts from 1895—1913, most of which are published here for the first time, testify the richness and open-endedness of his theory of logic and its applications. They also invite us to reconsider our ordinary conceptions of reasoning as well as the conventional stories told about the evolution of modern logic. This second volume collects Peirce's writings on existential graphs related to his Lowell Lectures of 1903, the *annus mirabilis* of his that became decisive in the development of the mature theory of the graphical method of logic.

The Textual Culture of English Protestant Dissent 1720-1800 Apr 19 2022 Religious dissenters and their literary and social heritage are the principal subjects of this book. At its

heart is a group of English men whose activities were local, transcontinental and circum-Atlantic. Drawing on letters, lecture notes, manuscript accounts of academies, and a range of printed texts and paratexts, *The Textual Culture of English Protestant Dissent 1720-1800* explores the connections between dissent, education, and publishing in the eighteenth century. By considering Isaac Watts and Philip Doddridge in relation to their mentors, students, friends, and readers, it emphasizes the importance they and their associates attached to personal relationships in their private interactions and in print. It argues that this contributed to a distinctive literary style as well as particular modes of textual production for moderate, orthodox dissenters which reached beyond their own community to address and influence global discourses about education, enlightenment, and history. The book's focus on "textual culture" foregrounds relationships between forms as well as considering texts as they existed in one form

or another. In examining textual culture, this book emphasises adaptation, transformation, fluidity and communality: it approaches the human relationships that make texts (including friendships, reading communities, intellectual exchange and business arrangements) with as much care as the content of the texts themselves. The book demonstrates that models of family and social authorship among Romantic-era dissenters advanced by Michelle Levy, Daniel White, and Felicity James were rooted in the domestic culture at earlier academies and in the example of members of the Watts-Doddridge circle.

Statistical Rethinking Jan 17 2022 *Statistical Rethinking: A Bayesian Course with Examples in R and Stan* builds readers' knowledge of and confidence in statistical modeling. Reflecting the need for even minor programming in today's model-based statistics, the book pushes readers to perform step-by-step calculations that are usually automated. This unique computational

approach ensures that readers understand enough of the details to make reasonable choices and interpretations in their own modeling work. The text presents generalized linear multilevel models from a Bayesian perspective, relying on a simple logical interpretation of Bayesian probability and maximum entropy. It covers from the basics of regression to multilevel models. The author also discusses measurement error, missing data, and Gaussian process models for spatial and network autocorrelation. By using complete R code examples throughout, this book provides a practical foundation for performing statistical inference. Designed for both PhD students and seasoned professionals in the natural and social sciences, it prepares them for more advanced or specialized statistical modeling. Web Resource The book is accompanied by an R package (rethinking) that is available on the author's website and GitHub. The two core functions (map and map2stan) of this package allow a

digitaltutorials.jrn.columbia.edu

variety of statistical models to be constructed from standard model formulas.

The Knights of Modernism Dec 04 2020

According to the customary literary-historical and theoretical notion, the fact that the first modern novel represents a parody or travesty of the chivalric ideal merits no particular attention. Failing to become attuned to the real role of the chivalric ideal at the beginning of the era of the modern novel, commentators missed the chance to adequately review the role of chivalry at the end of that period. The modern novel did not only begin, but also ended with a travesty of the chivalric ideal. The deep need of a significant number of modernist writers to measure their own time according to the ideals of the high and late Middle Ages cannot, therefore, be explained by a set of literary-historical, spiritual-historical or social circumstances. The predilection of a range of twentieth century novelists for a distant feudal past suggests that there exists a fundamental poetic connection between the

modern (or at least the modernist) novel and the ideals of chivalry.

Handbook to the Guide to the Evaluation of Educational Experiences in the Armed Services Jan 05 2021

Geotechnical Aspects of Underground

Construction in Soft Ground Nov 14 2021

Geotechnical Aspects of Underground Construction in Soft Ground comprises a collection of 112 papers, four general reports on the symposium themes, the Fujita Lecture, three Special Lectures and the Bright Spark Lecture presented at the Tenth International Symposium on Geotechnical Aspects of Underground Construction in Soft Ground, held in Cambridge, United Kingdom, 27-29 June 2022. The symposium is the latest in a series which began in New Delhi in 1994, and was followed by symposia in London (1996), Tokyo (1999), Toulouse (2002), Amsterdam (2005), Shanghai (2008), Rome (2011), Seoul (2014) and Sao

Paulo (2017). This was organised by the Geotechnical Research Group at the University of Cambridge, under the auspices of the Technical Committee TC204 of the International Society for Soil Mechanics and Geotechnical Engineering (ISSMGE). Geotechnical Aspects of Underground Construction in Soft Ground includes contributions from more than 25 countries on research, design and construction of underground works in soft ground. The contributions cover: Field case studies Sensing technologies and monitoring for underground construction in soft ground Physical and numerical modelling of tunnels and deep excavations in soft ground Seismic response of underground infrastructure in soft ground Design and application of ground improvement for underground construction Ground movements, interaction with existing structures and mitigation measures The general reports give an overview of the papers submitted to the symposium, covered in four technical sessions.

The proceedings include the written version of the five invited lectures covering topics ranging from developments in geotechnical aspects of underground construction, tunnelling and groundwater interaction (short and long-term effects), the influence of earth pressure balance shield tunnelling on pre-convergence and segmental liner loading (field observations, modelling and implications on design). Similar to previous editions, *Geotechnical Aspects of Underground Construction in Soft Ground* represents a valuable source of reference on the current practice of analysis, design, and construction of tunnels and deep excavations in soft ground. The book is particularly aimed at academics and professionals interested in geotechnical and underground engineering.

Complex Analysis Jul 11 2021 With this second volume, we enter the intriguing world of complex analysis. From the first theorems on, the elegance and sweep of the results is evident. The starting point is the simple idea of extending

a function initially given for real values of the argument to one that is defined when the argument is complex. From there, one proceeds to the main properties of holomorphic functions, whose proofs are generally short and quite illuminating: the Cauchy theorems, residues, analytic continuation, the argument principle. With this background, the reader is ready to learn a wealth of additional material connecting the subject with other areas of mathematics: the Fourier transform treated by contour integration, the zeta function and the prime number theorem, and an introduction to elliptic functions culminating in their application to combinatorics and number theory. Thoroughly developing a subject with many ramifications, while striking a careful balance between conceptual insights and the technical underpinnings of rigorous analysis, *Complex Analysis* will be welcomed by students of mathematics, physics, engineering and other sciences. *The Princeton Lectures in Analysis*

represents a sustained effort to introduce the core areas of mathematical analysis while also illustrating the organic unity between them. Numerous examples and applications throughout its four planned volumes, of which Complex Analysis is the second, highlight the far-reaching consequences of certain ideas in analysis to other fields of mathematics and a variety of sciences. Stein and Shakarchi move from an introduction addressing Fourier series and integrals to in-depth considerations of complex analysis; measure and integration theory, and Hilbert spaces; and, finally, further topics such as functional analysis, distributions and elements of probability theory.

Recent Developments in Particle Physics and Cosmology Aug 31 2020 The NATO Advanced Study Institute 2000 was held in Cascais, a small town located in a renowned beach resort area, near Lisbon. The aim of the Meeting was to provide an overview and to cover the recent developments in some of the most important

topics in Particle Physics and Cosmology, including Neutrino Physics, CP violation, B-Physics, Baryo genesis, Dark Matter, Inflation, Supersymmetry, Unified Theories, Large Extra-Dimensions and M-theory. In the NATO ASI 2000, we had the privilege to have among the lecturers, some of the most prominent physicists working in the fields of Particle Physics and Cosmology. Furthermore, there was a strong participation by a large number of young scientists, including graduate students and post-docs who had an opportunity to learn about the latest developments in the field and discuss the various topics with lecturers and other participants. The enthusiasm of the young participants, the generosity of the lecturers in giving their time to participate in open discussions and debates, together with the social events and the pleasant environment of Cascais, all contributed to the great success of the Meeting. We are very grateful to Camara Municipal de Cascais for their support and

organization of the reception in the beautiful Palace Condes Castro de Guimaraes and we are also specially grateful to colonel Eugenio de Oliveira for his support, to commander A. Monteiro de Macedo and to Mr.

Speaking the Truth about Oneself Aug 24 2022 "Speaking the Truth about Oneself is composed of lectures that acclaimed French philosopher Michel Foucault delivered in 1982 at the University of Toronto. As is characteristic of his later work, he is concerned here with the care and cultivation of the self, which becomes the central theme of the second and third volumes of his famous History of Sexuality, published in French in 1984, the month of his death, and which are explored here in a striking and typically illuminating fashion. Throughout his career, Foucault had always been interested

in the question of how constellations of knowledge and power produce and constitute subjects. But in the last phase of his life, he became especially interested not only in how subjects are constituted by outside forces but in how they constitute themselves. In this lecture series and accompanying seminar, we find Foucault focused on antiquity, starting with classical Greece, the early Roman dynasties, and concluding with fourth- and fifth-century Christian monasticism. Foucault's claim is that, in these periods, we see the development of a new kind of act-"speaking the truth" (about oneself)-as the locus of a new form of subjectivity, which he deemed important not just for historical reasons but also as something modernity could harness anew or adapt to its own purposes"--

Speaking the Truth about Oneself Mar 31 2023

Now in paperback, this collection of Foucault's lectures traces the historical formation and contemporary significance of the hermeneutics

of the self. Just before the summer of 1982, French philosopher Michel Foucault gave a series of lectures at Victoria University in Toronto. In these lectures, which were part of his project of writing a genealogy of the modern subject, he is concerned with the care and cultivation of the self, a theme that becomes central to the second, third, and fourth volumes of his *History of Sexuality*. Foucault had always been interested in the question of how constellations of knowledge and power produce and shape subjects, and in the last phase of his life, he became especially interested not only in how subjects are formed by these forces but in how they ethically constitute themselves. In this lecture series and accompanying seminar, Foucault focuses on antiquity, starting with classical Greece, the early Roman empire, and concluding with Christian monasticism in the fourth and fifth centuries AD. Foucault traces the development of a new kind of verbal practice—“speaking the truth about oneself”—in

which the subject increasingly comes to be defined by its inner thoughts and desires. He deemed this new form of “hermeneutical” subjectivity important not just for historical reasons, but also due to its enduring significance in modern society.

Ten Lectures on Random Media Feb 24 2020

The following notes grew out of lectures held during the DMV-Seminar on Random Media in November 1999 at the Mathematics Research Institute of Oberwolfach, and in February-March 2000 at the Ecole Normale Supérieure in Paris. In both places the atmosphere was very friendly and stimulating. The positive response of the audience was encouragement enough to write up these notes. I hope they will carry over the enjoyment of the live lectures. I wholeheartedly wish to thank Profs. Matthias Kreck and Jean-François Le Gall who were responsible for these two very enjoyable visits, Laurent Miclo for his comments on an earlier version of these notes, and last but not least Erwin Bolthausen

who was my accomplice during the DMV-Seminar. A Brief Introduction The main theme of this series of lectures are "Random motions in random media". The subject gathers a variety of probabilistic models often originated from physical sciences such as solid state physics, physical chemistry, oceanography, biophysics . . . , in which typically some diffusion mechanism takes place in an inhomogeneous medium. Randomness appears at two levels. It comes in the description of the motion of the particle diffusing in the medium, this is a rather traditional point of view for probability theory; but it also comes in the very description of the medium in which the diffusion takes place. *Lectures on Computational Fluid Dynamics, Mathematical Physics, and Linear Algebra* Dec 16 2021 Pt.
