Computational Atomic Physics deals with computational methods for calculating
electron (and positron) scattering from atoms and ions, including elastic scattering,
excitation, and ionization processes. Each chapter is divided into abstract, theory,
computer program with sample input and output, summary, suggested problems, and
references. An MS-DOS diskette is included, which holds 11 programs covering the
features of each chapter and therefore contributing to a deeper understanding of the
field. Thus the book provides a unique practical application of advanced quantum
mechanics. This introductory text offers a rigorous, comprehensive treatment. Classical
theorems of vector calculus are amply illustrated with figures, worked examples,
physical applications, and exercises with hints and answers. 1986 edition. This new
fourth edition of the acclaimed and bestselling Div, Grad, Curl, and All That has been
carefully revised and now includes updated notations and seven new example
exercises. "Everyone knows Warren is the greatest investor of our time. . . .This book

for the first time captures his genius as a manager." —Jack Welch The first book to reveal the investment and management strategies of the Berkshire Hathaway all-star management team. Much has been written about Warren Buffett and his investment philosophy; little has been made public about the inside management of Berkshire Hathaway. With a market cap exceeding 100 billion, Berkshire Hathaway has a market value surpassing many icons of American business such as Dell, AT&T, Disney, Ford, Gillette, American Express, and GM. Drawing on his personal experiences as well as those of Berkshire's chief executives, officers, and directors interviewed for this book, Berkshire insider Robert P. Miles provides a unique look at the Berkshire Hathaway culture and its management principles. Practical Finance for Property Investment provides readers with an introduction to the most fundamental concepts, principles, analytical methods, and tools useful for making investing and financing decisions regarding income-producing property. The book begins by considering how to value income-producing property by forecasting a property's cash flows and estimating appropriate discount rates. It then discusses how both debt and private equity are used as methods to finance a property's acquisition. The book provides a thorough discussion of the taxation of property income as well as how investors can quantify the risks to investing in property. The book concludes with important considerations for investors when their investment thesis does not come to fruition. Practical Finance for Property Investment offers a unique and novel pedagogy by pairing each book chapter with an in-depth real-world case study, which forces readers to confront the occasional tensions between finance theory and property investment practice. The book is designed for investors and students interested in learning what finance theory implies about property investment. Readers and Instructors can access electronic resources, including the spreadsheets used in the textbook, at the book's website: www.routledge.com/9780367333041. As the open-source and free competitor to expensive software like Maple™, Mathematica®, Magma, and MATLAB®, Sage offers anyone with access to a web browser the ability to use cutting-edge mathematical software and display his or her results for others, often with stunning graphics. This book is a gentle introduction to Sage for undergraduate students toward the end of Calculus II (single-variable integral calculus) or higher-level course work such as Multivariate Calculus, Differential Equations, Linear Algebra, or Math Modeling. The book assumes no background in computer science, but the reader who finishes the book will have learned about half of a first semester Computer Science I course, including large parts of the Python programming language. The audience of the book is not only math majors, but also physics, engineering, finance, statistics, chemistry, and computer science majors. Stewart's Multivariable CALCULUS: CONCEPTS AND CONTEXTS, FOURTH EDITION offers a streamlined approach to teaching calculus, focusing on major concepts and supporting those with precise definitions, patient explanations, and carefully graded problems. CALCULUS: CONCEPTS AND CONTEXTS is highly regarded because this text offers a balance of theory and conceptual work to satisfy more progressive programs as well as those who

are more comfortable teaching in a more traditional fashion. Each title is just one component in a comprehensive calculus course program that carefully integrates and coordinates print, media, and technology products for successful teaching and learning. The Multivariable Calculus edition contains chapters 11-18 of the full text, and is intended to serve as a single-semester text. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version. 'Vector Calculus' helps students foster computational skills and intuitive understanding with a careful balance of theory, applications, and optional materials. This new edition offers revised coverage in several areas as well as a large number of new exercises and expansion of historical notes. The stirring story of the reform movement that laid the groundwork for a modern mental health system in Minnesota In 1940 Engla Schey, the daughter of Norwegian immigrants, took a job as a low-paid attendant at Anoka State Hospital, one of Minnesota's seven asylums. She would work among people who were locked away under the shameful label "insane," called inmates—and numbered more than 12,000 throughout the state. She acquired the knowledge and passion that would lead to "The Crusade for Forgotten Souls," a campaign to reform the deplorable condition of mental institutions in Minnesota. This book chronicles that remarkable undertaking inspired and carried forward by ordinary people under the political leadership of Luther Youngdahl, a Swedish Republican who was the state's governor from 1946 to 1951. Susan Bartlett Foote tells the story of those who made the crusade a success: Engla Schey, the catalyst; Reverend Arthur Foote, a modest visionary who guided Unitarians to constructive advocacy; Genevieve Steefel, an inveterate patient activist; and Geri Hoffner, an intrepid reporter whose twelve-part series for the Minneapolis Tribune galvanized the public. These reformers overcame barriers of class, ethnicity, and gender to stand behind the governor, who, at a turbulent moment in Minnesota politics, challenged his own party's resistance to reform. The Crusade for Forgotten Souls recounts how these efforts broke the stigma of shame and silence surrounding mental illness, publicized the painful truth about the state's asylums, built support among citizens, and resulted in the first legislative steps toward a modern mental health system that catapulted Minnesota to national leadership and empowered families of the mentally ill and disabled. Though their vision met resistance, the accomplishments of these early advocates for compassionate care of the mentally ill hold many lessons that resonate to this day, as this book makes compellingly clear. Thermo-Mechanical Processing of Metallic Materials describes the science and technology behind modern thermo-mechanical processing (TMP), including detailed descriptions of successful examples of its application in the industry. This graduate-level introductory resource aims to fill the gap between two scientific approaches and illustrate their successful linkage by the use of suitable modern case studies. The book is divided into three key sections focusing on the basics of metallic materials processing. The first section covers the microstructural science base of the subject, including the microstructure determined mechanical properties of metals. The second section deals with the current mechanical technology of plastic forming of

metals. The concluding section demonstrates the interaction of the first two disciplines in a series of case studies of successful current TMP processing and looks ahead to possible new developments in the field. This text is designed for use by graduate students coming into the field, for a graduate course textbook, and for Materials and Mechanical Engineers working in this area in the industry. * Covers both physical metallurgy and metals processing * Links basic science to real everyday applications * Written by four internationally-known experts in the field

Abstract: Hierarchical Temporal Memory (HTM) technology is a new computing paradigm based on the structure and function of the human neocortex [15]. HTM networks are the cornerstone technology in the Numenta Platform for Intelligent Computing (NuPIC), a new tool for artificial intelligence research developed by Numenta Incorporated. NuPIC provides researchers with a series of tools that they can use to train and test their HTM networks. Ultimately the developers of NuPIC believe that the long term applications will include image analysis, robotics, data mining, and intelligent systems for traffic monitoring and weather prediction [7]. However, up to this point HTM networks have only been used to develop a simple vision system that is limited to recognizing a small set of line drawings. Before researchers can claim to have realized the ultimate promise of NuPIC, they must utilize the technology to solve problems across wide range of subjects. The purpose of the research presented in this thesis is to provide an experience report of HTM technology and identify best practices for future HTM researchers. In order to facilitate this experience a solution to the non-trivial problem of song identification was developed. This problem is well-researched and hundreds of papers have been written that range from using signal processing techniques [13] to sampling an artist's work for unique features [16]. Several advanced solutions using existing technologies have been created and developing an equivalent solution to this problem using NuPIC helped identify several areas in need of more in-depth research. In order to ensure that a successful song identification development experience was reached, several preparatory steps were taken. At the beginning of this research NuPIC was a relatively new artificial intelligence framework and there were no established processes for design, implementation, or testing. To remedy this shortcoming, NuPIC's extensive training material was used to develop a more formal methodology for using the technology. One of the first steps in this newly created process was to develop an in-depth understanding of the data being used. In order gain this knowledge multiple digital music formats were researched. This analysis revealed that the Midi music format was the best candidate to produce data for HTM network consumption. The next step was then to use the Midi song data to run several song identification experiments using NuPIC in order to test different encoding schemes and diverse HTM network structures. A data encoding scheme based on melodic segmentation yielded an identification accuracy of 100% and supports the conclusion that NuPIC is a valid platform for further research in the area of song identification. The song identification development experience also identified several areas in need of more in-depth research. Many of the algorithms used in HTM networks are designed to work with very specific

data encoding schemes. In order for HTM technology to gain more widespread use, these algorithms must be improved. HTM networks also require that input data follows a strict partition-based format. Switching to a XML-based data input format would allow researchers to quickly generate and validate data sets. Lastly, the development experience presented in this thesis shares many similarities with the development processes created by the data mining community. Researchers wishing to increase their likelihood of success should look for ways to incorporate the data mining community's knowledge into their research. Fourier transform theory is of central importance in a vast range of applications in physical science, engineering, and applied mathematics. This new edition of a successful student text provides a concise introduction to the theory and practice of Fourier transforms, using qualitative arguments wherever possible and avoiding unnecessary mathematics. After a brief description of the basic ideas and theorems, the power of the technique is then illustrated by referring to particular applications in optics, spectroscopy, electronics and telecommunications. The rarely discussed but important field of multi-dimensional Fourier theory is covered, including a description of computer-aided tomography (CAT-scanning). The final chapter discusses digital methods, with particular attention to the fast Fourier transform. Throughout, discussion of these applications is reinforced by the inclusion of worked examples. The book assumes no previous knowledge of the subject, and will be invaluable to students of physics, electrical and electronic engineering, and computer science. This revision aims to address changes that have taken effect since the publication of the second edition. The most significant change has been in the attitude of industry to concurrent engineering. In 1987, mostly lip service was paid to it; today, it has become general practice in most competitive corporations. In the second edition, the author discussed this as the manufacturing system. In the third edition it becomes the focal point. Concurrent engineering involves the whole product realization process, including product concept, performance criteria, mechanical design and analysis, materials selection, process planning and modeling, production control, automation, assembly, management, and others. An introductory text cannot possibly cover all of these topics, hence the emphasis of the third edition remains on the physical principles and the application of these principles to processes. The major difference relative to the second edition will be the emphasis on interactions between process and design. Capabilities and limitations of processes will be highlighted to show what they mean in terms of design possibilities, and design modifications will be suggested for ease of manufacture. Impact on the environment and possibilities for recycling will be woven into the entire text. The technological field of defects, and more appropriately, avoidance of them, is very current in perhaps all sectors of the manufacturing industry. This is particularly important to reduce/minimize waste everywhere to address lean production procedures. The recent advances in finite plasticity and viscoplasticity, damage modelling, instability theories, fracture modelling, computer numerical techniques and process simulation etc. offer new approaches and tools for defect prediction, analyses and guidelines for designing

components to be manufactured by traditional and emerging process technologies. This volume contains contributions from well known researchers and experts in the field presenting an up-to-date overview of advances in this area. Subjects covered include: micro- and macro-scale observation of defects; localization and instability analysis; damage modelling and fracture criteria; defect prediction methods; design considerations to avoid defects.

Vector Analysis and Cartesian Tensors, Second Edition focuses on the processes, methodologies, and approaches involved in vector analysis and Cartesian tensors, including volume integrals, coordinates, curves, and vector functions. The publication first elaborates on rectangular Cartesian coordinates and rotation of axes, scalar and vector algebra, and differential geometry of curves. Discussions focus on differentiation rules, vector functions and their geometrical representation, scalar and vector products, multiplication of a vector by a scalar, and angles between lines through the origin. The text then elaborates on scalar and vector fields and line, surface, and volume integrals, including surface, volume, and repeated integrals, general orthogonal curvilinear coordinates, and vector components in orthogonal curvilinear coordinates. The manuscript ponders on representation theorems for isotropic tensor functions, Cartesian tensors, applications in potential theory, and integral theorems. Topics include geometrical and physical significance of divergence and curl, Poisson's equation in vector form, isotropic scalar functions of symmetrical second order tensors, and diagonalization of second-order symmetrical tensors. The publication is a valuable reference for mathematicians and researchers interested in vector analysis and Cartesian tensors.

Carl Wieman's contributions have had a major impact on defining the field of atomic physics as it exists today. His ground-breaking research has included precision laser spectroscopy; using lasers and atoms to provide important table-top tests of theories of elementary particle physics; the development of techniques to cool and trap atoms using laser light, particularly in inventing much simpler, less expensive ways to do this; the understanding of how atoms interact with one another and light at ultracold temperatures; and the creation of the first Bose-Einstein condensation in a dilute gas, and the study of the properties of this condensate. In recent years, he has also turned his attention to physics education and new methods and research in that area. This indispensable volume presents his collected papers, with annotations from the author, tracing his fascinating research path and providing valuable insight about the significance of the works. "I worked in a trailer that ICE had set aside for conversations between the women and the attorneys. While we talked, their children, most of whom seemed to be between three and eight years old, played with a few toys on the floor. It was hard for me to get my head around the idea of a jail full of toddlers, but there they were." For decades, advocates for refugee children and families have fought to end the U.S. government's practice of jailing children and families for months, or even years, until overburdened immigration courts could rule on their claims for asylum. *Baby Jails* is the history of that legal and political struggle. Philip G. Schrag, the director of Georgetown University's asylum law clinic, takes readers through thirty years of conflict over which refugee advocates resisted the

detention of migrant children. The saga began during the Reagan administration when 15-year-old Jenny Lisette Flores languished in a Los Angeles motel that the government had turned into a makeshift jail by draining the swimming pool, barring the windows, and surrounding the building with barbed wire. What became known as the Flores Settlement Agreement was still at issue years later, when the Trump administration resorted to the forced separation of families after the courts would not allow long-term jailing of the children. Schrag provides recommendations for the reform of a system that has brought anguish and trauma to thousands of parents and children. Provocative and timely, *Baby Jails* exposes the ongoing struggle between the U.S. government and immigrant advocates over the duration and conditions of confinement of children who seek safety in America.

Mathematics majors at Michigan State University take a "Capstone" course near the end of their undergraduate careers. The content of this course varies with each offering. Its purpose is to bring together different topics from the undergraduate curriculum and introduce students to a developing area in mathematics. This text was originally written for a Capstone course. Basic wavelet theory is a natural topic for such a course. By name, wavelets date back only to the 1980s. On the boundary between mathematics and engineering, wavelet theory shows students that mathematics research is still thriving, with important applications in areas such as image compression and the numerical solution of differential equations. The author believes that the essentials of wavelet theory are sufficiently elementary to be taught successfully to advanced undergraduates. This text is intended for undergraduates, so only a basic background in linear algebra and analysis is assumed. We do not require familiarity with complex numbers and the roots of unity. Gauss's law for electric fields, Gauss's law for magnetic fields, Faraday's law, and the

Ampere–Maxwell law are four of the most influential equations in science. In this guide for students, each equation is the subject of an entire chapter, with detailed, plain-language explanations of the physical meaning of each symbol in the equation, for both the integral and differential forms. The final chapter shows how Maxwell's equations may be combined to produce the wave equation, the basis for the electromagnetic theory of light. This book is a wonderful resource for undergraduate and graduate courses in electromagnetism and electromagnetics. A website hosted by the author at www.cambridge.org/9780521701471 contains interactive solutions to every problem in the text as well as audio podcasts to walk students through each chapter. This publication has been written to honour the contribution to science and education made by the Distinguished Professor Emeritus Professor Schey on his eightieth birthday. The contributors to his book are among the countless researchers who have read, studied and learned from Professor Schey's work, which includes books, research monographs, invited papers, keynote papers, scientific journals and conferences. The topics include manufacturing, sheet and bulk metal forming and tribology, amongst others. The topics included in this book include: John Schey and value-added manufacturing; Surface finish and friction in cold-metal rolling; Direct observation of interface for tribology in metal forming; An examination of the coefficient of friction; Studies on micro plasto hydrodynamic lubrication in metal forming; Numerical simulation of sheet metal forming; Geometric and mechanics model of sheet forming; Modelling and optimisation of metal forming processes; The mathematical modelling of hot rolling steel; Identification of rheological and tribological parameters; Oxide behaviour in hot rolling; Friction, lubrication and surface response in wire drawing; and Modelling and control of temper rolling and skin pass rolling. This book gathers knowledge about matrix-assisted laser desorption ionisation (MALDI) mass spectrometry imaging for postgraduate and professional researchers in academia and in industry where it has direct application to clinical research. "The Lord would speak to Moses face to face, as one speaks to a friend" (Exod. 33:11). In the book of Exodus, God provides instructions in the Ten Commandments, sacrifices, the building of the tabernacle, and many other topics. In these conversations, God is giving Moses direction. Moses had forty years in the wilderness speaking with God. Apart from the directives, what might these friendly conversations be? Perhaps they were of a nature similar to those questions and discussions we might have with a friend about our faith. In the years I've had reading the Bible and in communion with others, many friends have asked me questions and I've asked God many questions as well, such as, "If God were so loving, why does he allow so much suffering in the world?" or "Why do bad things happen to good people?" Rather than search scripture to seek answers, many dismiss the faith. Indeed, we are told that scripture holds the answers to many of our questions but there is no index in the Bible where we can look up our questions. Rather, it is in the study and knowledge of God gained from daily reading and meditation that we can truly find answers. This book is intended to serve several purposes. The first is to illustrate that truly, the Bible is the source for answers to our questions and to show how it can be used. Secondly, many Christians have little knowledge of the Old Testament so taking the questions from the viewpoint of Moses exposes us to the life at that time but also illustrates the many rich traditions and meanings referenced in the New Testament. Third, Moses is a pillar of the faith and worthy of study on his own because he was a unique and blessed person.
