Data centers play an integral role in IT organizations, they either make or break the IT organizations. Despite data centers are like the heart and brain of IT organizations, yet there are very few books on data centers. If there are some, they are very technical and difficult to be understood by beginners and management professionals of IT. And few years back when I had some meetings with some IT managers, experienced professionals and consultants, it was a shock for me that they had no idea on basic data center environment, terminology and operations. When I have surveyed their interest on this area, they were very inquisitive to learn and also saddened that they couldn't find any easily understandable materials on this subject area. Hence, here is a book on data centers giving an overview on data center operations and my consulting knowledge in data center management which I have been writing for the last 3 years. The focus is on topics like basics of data center terminology, checklists for data center operations, roles and responsibilities in data center management, essentials for data center management operations, metrics, data center setup, data center migration, data center site selection, auditing data center, due diligence questions for data center management, green data center and best practices, and interview questions for data center management positions. This book will be very useful for the beginners like people who have just joined in IT, experienced professionals who have very basic knowledge on data centers, and management people who can get the most important epitome on data center operations and environment. In my opinion, the prerequisite for reading this book is that the reader should have basic understanding of information technology and should be a working professional in IT. "This report presents guidance for state departments of transportation (DOTs) and other agencies for the use of knowledge capture and active learning to ensure that essential, mission-critical knowledge is maintained within the agency when a contractor's work is finished, particularly in those program areas that pose the greatest risk to the agency's performance. Knowledge capture is the process of transforming human knowledge into codified information (for example, through documentation of interviews with key contractor personnel) and making the information available to others. Active learning occurs when DOT staff work directly with contractors or consultants. The research team reviewed the literature and conducted focus groups to review current practices in a range of organizational settings. The team developed a framework for guidance suited to the needs of DOTs and then undertook case studies of organizations that have successfully adopted practices for capture and active learning of

essential knowledge developed by contractors and consultants. The guidance and background information presented here will help to ensure that DOT staff and others responsible for system management, emergency response, and other critical components of the agency's mission have access to the knowledge they need to be effective in pursuit of that mission." -- Publisher's description.
