It gives me great pleasure to introduce this book on HISTOPATHOLOGY for Medical Laboratory Technology Students. In this book I have tried to solve the difficulty of students to understand the tests and getting the exact data. The aims and objectives of this book are primarily to meet the requirements of DMLT and undergraduates Courses. Histopathology is an essential subject of DMLT courses, but there is non-availability of good books on the subject. The books available are vast and mainly written for medical, dental, physiotherapy, nursing students. I have tried to overcome this problem by writing in easy language, point-wise manner, diagrams, flow charts, tables, graphs, pictures and providing exact data. I hope that this book will satisfy the needs of DMLT students as well as UG students. This book composes units. All units such as, Histopathology, Clinical pathology, cytology, exfoliative cytology etc. Finally, we can say this book is based upon the DMLT syllabus of the various Paramedical state councils, especially JKSPMF and JKBOTE. Finally, although sincere effort has been made to be as accurate as possible, an element of human error is still likely. I shall humbly request users to continue giving their valuable suggestions and feedback as they have been doing. Before for my all books, this helps me much to learn from the experience of users, improve further and carry out corrections wherever required, at the earliest possible opportunity, All the chapters in this book for medical laboratory technology students place emphasis on the clinical relevance of biochemistry. Where appropriate, the text has been supplemented with suitable diagrams and tables, as well as relevant practical exercises and text questions. Curricula in the health sciences have undergone significant change and reform in recent years. The time allocated to anatomical education in medical, osteopathic medical, and other health professional programs has largely decreased. As a result, educators are seeking effective teaching tools and useful technology in their classroom learning. This edited book explores advances in anatomical sciences education, such as teaching methods, integration of systems-based components, course design and implementation, assessments, effective learning strategies in and outside the learning environment, and novel approaches to active learning in and outside the laboratory and classroom. Many of these advances involve computer-based technologies. These technologies include virtual reality, augmented

reality, mixed reality, digital dissection tables, digital anatomy apps, three-dimensional (3D) printed models, imaging and 3D reconstruction, virtual microscopy, online teaching platforms, table computers and video recording devices, software programs, and other innovations. Any of these devices and modalities can be used to develop large-class practical guides, small-group tutorials, peer teaching and assessment sessions, and various products and pathways for guided and self-directed learning. The reader will be able to explore useful information pertaining to a variety of topics incorporating these advances in anatomical sciences education. The book will begin with the exploration of a novel approach to teaching dissection-based anatomy in the context of organ systems and functional compartments, and it will continue with topics ranging from teaching methods and instructional strategies to developing content and guides for selecting effective visualization technologies, especially in lieu of the recent and residual effects of the COVID-19 pandemic. Overall, the book covers several anatomical disciplines, including microscopic anatomy/histology, developmental anatomy/embryology, gross anatomy, neuroanatomy, radiological imaging, and integrations of clinical correlations. Now in its revised and expanded second edition - including over 20 new chapters - this comprehensive textbook remains a unique and accessible description of the current and developing diagnostic and treatment techniques and technologies comprising in vitro fertilization (IVF). Arranged thematically in sections, each chapter covers a key topic in IVF in a sensible presentation. Parts one and two describe the planning, design and organization of an ART unit and IVF laboratory and equipment and systems, respectively. The sections that follow provide detailed descriptions of IVF techniques, embryo culture methods, sperm processing and selection, insemination procedures, micromanipulation, embryo evaluation, cryopreservation, and embryo transfer. Concluding sections address issues of management and regulation of ART labs across the globe, as well as special topics and emerging techniques and devices. Chapter authors, all experts in the field, contribute their expertise from around the world. With the addition of learning key points and review questions at the beginning and end of each chapter, this new edition of In Vitro Fertilization is a readily accessible, high quality instructional resource for reproductive medicine trainees at all levels. Practicing reproductive endocrinologists, urologists, and embryologists also will find value in the book, as will infertility researchers.
