Steve and Susan Zumdahl's texts focus on helping students build critical thinking skills through the process of becoming independent problem-solvers. They help students learn to think like a chemists so they can apply the problem solving process to all aspects of their lives. In CHEMISTRY: AN ATOMS FIRST APPROACH, the Zumdahls use a meaningful approach that begins with the atom and proceeds through the concept of molecules, structure, and bonding, to more complex materials and their properties. Because this approach differs from what most students have experienced in high school courses, it encourages them to focus on conceptual learning early in the course, rather than relying on memorization and a plug and chug method of problem solving that even the best students can fall back on when confronted with familiar material. The atoms first organization provides an opportunity for students to use the tools of critical thinkers: to ask questions, to apply rules and models and to evaluate outcomes. Now in its second edition, this book focuses on practical algorithms for mining data from even the largest datasets. Jim Kalat's best-selling INTRODUCTION TO PSYCHOLOGY takes a critical thinking approach to the major theories and concerns of psychology. Kalat's blend of humorous writing style with fun, hands-on Try It Yourself activities, gives students an engaging learning experience that gets them involved with even the most intimidating concepts. This proven approach has won the text well-deserved praise from instructors and students alike. By prompting students to ask themselves questions like How was this conclusion reached? and Does the evidence really support it?, Kalat encourages the use of scientific principles that psychologists utilize when attempting to answer questions about human intellect, emotion, and behavior. This approach helps students separate what merely sounds plausible from what is scientifically provable -- both in the psychology classroom and beyond it. With the text's carefully crafted content and pedagogy, as well as its supporting learning tools, students are able to see the study of psychology as an endeavor that has relevance to their scholastic and personal lives. The Ninth Edition builds upon the text's reputation for incorporating timely information that draws on the latest research and literature. Think about the most powerful speech you've ever heard a leader give. What made that speech--and that speaker--memorable was likely a mix of authenticity, stage presence, masterful delivery, and--above all--an inspirational message. Nobody ever walked out of a great speech saying, "I loved the way she used PowerPoint." Yet, all too often, speakers rely on tools like it to carry them through a presentation. Real leaders speak to make a difference, to promote a vision, to change the way people think and feel and act. Their ability to lead goes hand in hand with their ability to get their message across, no matter what size audience they're addressing. Drawing on his years of experience in coaching executives, Christopher Witt shows not just how to make a speech but why and when you should make one. His practical advice on how to take your game to the next level includes: • You are the message. Who you are--your character, experience, values--shapes the message your listeners hear. • Content is king. Delivery is important, but it is only the helpful--or unhelpful--servant of your message. So build each speech around one, and only one, "Big Idea." • A confused mind always says no. When you want your listeners to say yes, you've got to make them understand what you want them to do and why they should care. • Dare to do the unexpected. Leaders know the rules, and they know when, why, and how to break them. In chapters that can be read in five minutes or less and in a book that can be gone through in one sitting, Witt shows you how to become more confident, more commanding, more compelling speakers. But this isn't just a book about speaking. It's about leadership and about how people--CEOs and PTA presidents, small business owners and sales reps, middle managers and techno geeks--can present themselves and their ideas with greater impact. Designed to be used in class, SocNotes for Society, 9/e mirror the PowerPoint presentation slides. This study companian contains each powerpoint slide, outlining the main topics and concepts with space for student note taking. Database System Concepts by Silberschatz, Korth and Sudarshan is now in its 7th edition and is one of the cornerstone texts of database education. It presents the fundamental concepts of database management in an intuitive manner geared toward allowing students to begin working with databases as quickly as possible. The text is designed for a first course in databases at the junior/senior undergraduate level or the first year graduate level. It also contains additional material that can be used as supplements or as introductory material for an advanced course. Because the authors present concepts as intuitive descriptions, a familiarity with basic data structures, computer organization, and a high-level programming language are the only prerequisites. Important theoretical results are covered, but formal proofs are omitted. In place of proofs, figures and examples are used to suggest why a result is true. Elementary Differential Equations and Boundary Value Problems 11e, like its predecessors, is written from the viewpoint of the applied mathematician, whose interest in differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. The authors have sought to combine a sound and accurate (but not abstract) exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and approximation that have proved useful in a wide variety of applications. While the general structure of the book remains unchanged, some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications. In addition to expanded explanations, the 11th edition includes new problems, updated figures and examples to help motivate students. The program is primarily intended for undergraduate students of mathematics, science, or engineering, who typically take a course on differential equations during their first or second year of study. The main prerequisite for engaging with the program is a working knowledge of calculus, gained from a normal two or three semester course sequence or its equivalent. Some familiarity with matrices will also be helpful in the chapters on systems of differential equations.
