Initial coin offerings (ICOs) are one of the major innovations that characterize the digital revolution of financial markets. Among the expectations created by the digital revolution is the democratization of entrepreneurial finance, defined in terms of the creation of more equality regarding the access to financial resources by categories known to be underrepresented among potential entrepreneurs. Following this line of research, we investigate, through two complementary

empirical studies, whether gender, ethnicity, and geography affect the choice of ICOs vs. traditional financing alternatives. Additionally, we assess whether these characteristics increase the amount of money an entrepreneur can raise. In Study I, we compare 390 ICO ventures to a sample of 1,078 VC-backed block-chain ventures, identifying a negative correlation between the choice of an ICO (vs. VC-backing) and a location in an urban area. In Study II, we compare 160 ICO ventures to 163 real estate investment trusts (REITs), reaffirming the results of Study I. The findings show significant participation and likelihood of successful campaigns for ethnic minorities in ICOs, with the latter also being able to collect, *ceteris paribus*, larger amounts of funding. In contrast, female entrepreneurs do not have higher chances to participate nor raise funds in ICOs. The conference focuses on hardware, software, and algorithmic developments and the World Ocean research and exploration approaches. The main emphasis is on marine robotics and related areas, including autonomous underwater and surface vehicles, remotely controlled vehicles, underwater communications, and navigation. As these areas heavily depend on sound propagation in the seawater, attention is also paid to computational acoustics, seismic acoustics, and oceanography and its applications. The implementation of mentioned technologies for underwater environmental monitoring is also considered alongside marine ecosystem simulation techniques and its digital twins. The great and fastening strides of the Fintech revolution continuously transform once-static traditional

financial industry and provision of credit in particular. Blockchain innovation has led to creation of new industry of raising funds without the need for financial intermediaries such as venture capital or banks. In this book we build up a holistic picture of the token sales or initial coin offerings (ICOs) from their inception in 2013 to our days. We analyze the initial phases of the industry's development, collecting information on all campaigns or ICO attempts in this period, providing a thorough quantitative analysis of the phenomenon. We also provide a detailed account of token sales mechanics and overview all the main actors in this new ecosystem of blockchain-based financing. By leveraging the open data on token sales contributions, we study the behavior of token sales investors and find out that recurrent investors do not succeed in selecting better ICO projects but bigger investors do. In the last part of the book, we study crypto tokens as investments and overview their functionality and risks involved, as well as look at the alternative methods of creating and distributing tokens and compare them to token sales.

Research on initial coin offerings (ICOs) is nascent and assesses ICOs from ventures' and regulators' perspectives. Little is known about the equally important group of investors who provide their capital to ventures in ICOs. Using a primary dataset of 517 ICO investors collected in 2018, we perform a factor analysis to identify and categorize the motivations to invest in ICOs. We find that investors are driven by ideological motives, technological motives, and financial motives. To profile investors according to these motives, we then conduct a regression analysis

to distinguish investors with high scores across the different motives. For example, we show significant differences across motives with regard to investors' risk perception and the demand for a strict regulation. The implications of this study for theory and practice are considerable and discussed in detail. When people hear the words ICOs, Ripple, Bitcoin, Cryptocurrency, Bitcoin or Mining they immediately shout: Cryptocurrencies have no value, why should I pay for them? ICOs are all scams Ripple is overvalued Initial Coin Offerings are not legal You hear this at family tables, Christmas gatherings, club meetings and so much more. This is due to the fact, that the Blockchain and cryptocurrency discussion has emerged from specialized forums and not the broader public sphere. Shockingly there is very much superficial knowledge floating around. Not only between individuals but also poorly researched news articles which badly compare ICOs to IPOs. Initial Coin Offerings (ICO) are discussed everywhere. Yet much superficial knowledge is discussed. There is no good guide for what to look out for or how to participate in an ICO. Having researched the Blockchain Technology during my Ph.D. studies, I will introduce the ICO to you as well as present my opinion on its potential. In this book, we will start with looking at the high-level concept of cryptocurrencies with its two dominant players Bitcoin and Ether before diving into the Initial Coin Offerings (ICO) and a general market overview. Understanding the ICO Landscape is a cornerstone of your research into ICO investments. Having successfully laid the groundwork we will discuss the steps of an ICO investment, before reaching the core of your analysis - the evaluation of an ICO. Therefore, navigating the maze of substandard information and quality sources is your first task of your investment research. Certainly, it also begs the question - before even starting with your research - if this is a worthwhile endeavor or if the whole cryptocurrency and ICO scene will rapidly disappear. To answer this, let's first look at a few examples from the past. With the invention of the automobile, very little people initially thought that this stinking and loud vehicle would sometime replace the horse carriage. Now, look at today. What we can learn from this example is two-fold. First, innovations face a lot of criticism at first and are only adopted by a small enthusiastic group. So-called early adopters. Secondly, the first product (so-called Minimal Viable Product or MVP) usually isn't pretty. Yet, the car is widely used nowadays. This is due to the fact that the value of the innovation is long-term (fast transport from A to B) and the ecosystem (gas stations, paved roads) grew fast. Subsequently, we can see that the growth phase of innovations with so-called "network effects" is accompanied by a competition for standards. In our example the mixture of gas or in the example of the invention of electric light the war of currents between George Westinghouse's alternating current (known as AC) standard versus Thomas Alpha Edisons direct current (DC) standard. We can see the same pattern when it comes to the underlying technology of cryptocurrencies

and tokens (e.g. ICOs). Now the question is if the use of the Blockchain Technology can deliver long-term value and therefore can lead to a mass adoption. This question is inherently connected to the discussion of a society without paper money. Surely you will agree that the age of paper money is ending, as we mostly pay with credit cards and bank transfers. Now the question is if the costly institutions of this system can be replaced by this new decentralized network technology called Blockchain. These questions can only be answered by researching the underlying principles. In this book, I will guide you in understanding Blockchain and Initial Coin Offerings. This research paper explores the contributing factors behind the success of 146 ICOs from June 2017 to November 2017 by analysing the role of ICO characteristics, team quality and market sentiment behind each ICO on the short-term return on investment, first-day return and the total amount raised in the ICO. The results indicate, among other factors, that the initial price of the token in the ICO is negatively correlated to the four-month ROI and first-day returns, the use of the Ethereum platform in an ICO is negatively correlated to first-day returns and the greater the number of years of leadership experience the CEO has as well as the size of the team is positively correlated to the amount raised in the ICO. This research is the first of its kind to incorporate news article features, Google search statistics as well as specific management team criteria for a sample of ICOs and will contribute to the further development of ICO due diligence processes and serve as a guide to investors and ICO team members interested in identifying the positive signals behind successful ICOs. In an initial coin offering (ICO), new ventures raise capital by selling tokens to a crowd of investors. Often, this token is a cryptocurrency, a digital medium of value exchange based on the distributed ledger technology. Both the number of ICOs and the amount of capital raised have exploded since 2017. Despite attracting significant attention from ventures, investors, and policy makers, little is known about the dynamics of ICOs. This initial study therefore assesses the determinants of the amount raised in 423 ICOs. Drawing on signaling theory, the study explores the role of signaling ventures' technological capabilities in ICOs. The results show that technical white papers and high-quality source codes increase the amount raised, while patents are not associated with increased amounts of funding. Exploring further determinants of the amount raised, the results indicate that some of the underlying mechanisms in ICOs resemble those found in prior research into entrepreneurial finance, while others are unique to the ICO context. The study's implications are multifold and discussed in detail. Importantly, the results enable investors to more accurately understand crucial determinants of the amount raised (e.g., technical white papers, source code quality, token supply, Ethereum-standard). This reduces the considerable uncertainty that investors face when investing in ICOs and enables more informed decision-making. Perfect

Initial Coin Offerings (ICOs) as a capital raising method on Blockchain has been the fastest growing capital raising method in the past two years with more than USD 6 billion total fund raised in 2017. This thesis develops an empirically grounded model to explain ICOs with deep analysis of their key elements, which has not been seen in existing literatures so far. To further classify ICOs into different archetypes for a deeper understanding of ICOs, this thesis develops an empirical taxonomy based on its grounded ICO model. The empirical taxonomy goes beyond the current conceptual classification and identifies four generic archetypes of ICOs: Blockchain Infrastructure, Product Pre-sale, Traditional Funding Substitute, and Pure Digital Currency, all of which differ in the defining elements of ICOs. The grounded model and the taxonomy both show the diversity and complexity of ICOs and provide a solid ground for understanding ICOs as well. The thesis contributes to the literature and ICO research by clearly depicting the ICO landscape and identifying different ICO archetypes. For practitioners, this thesis helps a better understanding and hence a better organisation of ICOs. For regulators, the understanding to the nature of ICOs through this thesis benefits to do a more sophisticated policy making. Initial coin offerings (ICOs) emerged as a new entrepreneurial financing tool for startups that is based on blockchain technology. Having many advantages over traditional funding methods such as venture capital (VC), crowdfunding, and initial public offerings, ICOs gained significant attention in the last three years. Yet, little is known about this phenomenon. This thesis provides a better understanding of why startups conduct ICOs and why they are not using VC funding instead. By applying the Eisenhardt Method, case studies of nine startups are compared to recognize patterns among them, which result in the emergent theory. The study finds that companies conduct ICOs because of three

main drivers: (a) to realize the product development potential of blockchain technology, (b) to develop and involve a community, or (c) to exploit an opportunistic way to raise capital. Companies that are able to attract VC view ICOs as a complement tool to traditional funding. They often pursue a hybrid model, which combines VC and an ICO, to capture the value from both funding tools. This model is likely to become more established in the future and will have an impact on venture funding. The volume of Initial Coin Offerings has risen steeply with an all-time high market capitalisation of close to USD 1 trillion in December 2017. Since then the digital asset market has slumped, retreating to merely approximately USD 200 billion in mid-2018. Stakeholders of the crypto industry have pondered the reasons for this retrenchment and are increasingly focusing on the notion that many ICOs could be scams. A recent industry study even went as far to claim that 80% of all ICOs are indeed scams. In this paper, we investigate the question whether scams are as common in the crypto field. We do so by, first, defining what a scam is and, secondly, by drawing on empirical data to assess the number of cases fitting such a definition. Building on Principal Agent Theory and based on the statistical analysis of our empirical data set we attempt to establish the current state of affairs with regards to scams in the crypto-currency world. The results of our study divert from salient beliefs. Perfect cryptocurrency journal for converting \$1000 into \$1 million by investing in good quality projects and ICOs. Remember that Bitcoin is not a digital currency. It is a technology and that technology is revolutionary. This research book aims at giving an objective point of view of potential impacts of blockchain and Initial Coin Offerings (ICOs) in the capitalistic system we know. This book contains theoretical research facing practical researches -interviews mostly- to give the most objective view of the innovative potential of blockchain and ICOs especially concerning Venture Capitalist field. Resume : Venture Capitalist job has been on the track of high risk investment for 100 years and empowered during dot-com era. However, is the industry ready for a combination of new bleeding edge technologies?Blockchain and Initial Coin Offerings are completely changing the way of seeing investment and have a real potential on changing Venture Capitalism ecosystem.Blockchain based start-up have started using Initial Coin Offerings to raise tremendous funds for a final goal: conquer the world.In the meantime, institutional actors and big corporations have started to race on the subject.An ecosystem is being created and the disruptive wave is coming.It does not only concern Venture Capitalist firms but also the whole financial system which lead to one big question: is the capitalism as we know it taking its last breath? Initial Coin Offerings (ICOs) emerged as a new type of fundraising that is conducted over the

web and is mainly used by open-source blockchain-type start-ups to get their business started. While ICOs recently attracted a lot of attention from investors as well as the media, research on this topic is still nascent. The aim of this paper is to collect and analyze currently available information on ICOs in order to provide foundational knowledge on this rather young phenomenon. To derive a first working definition of the concept, we compare ICOs to more established fundraising mechanisms (i.e. Crowdfunding, Venture Capital and Initial Public Offerings) to identify main differences and commonalities. Furthermore, we provide a short overview of how ICOs work as well as the business models that are associated with this type of funding. Finally, we discuss the broader implications of this new type of fundraising. Therefore, the paper discusses two major potentials of ICOs, which lie 1) in the democratization of venture capital as well as 2) in incentivizing the creation of new protocol technologies that form the basis for new innovative business models. Our main contribution lies in providing researchers an overview and a conceptualization of Initial Coin Offerings. In doing so, we hopefully encourage more researchers to pick up this interesting topic and to produce research on their own to further advance the field. Blockchain technology also is one of the most exciting technologic developments in this decade beyond any doubt. In 2009, the first decentralized digital currency also referred to as a cryptocurrency, Bitcoin launched. It was not demanding in the beginnings. However, today, there are many discussions about possibilities of replacing fiat currencies with cryptocurrencies and there is already a \$ billion market size. This paper studies how cryptocurrencies and Initial Coin Offering (ICO) work and discuss potential qualifications of these new terms to help regulatory bodies understand and take steps with enough knowledge. To this end, the research question is as follows: What is the cryptocurrency exactly? What are their technologic differences and features? and how exactly can qualify cryptocurrencies as money, security or anything else and examines its legality for many aspects? And legal aspects of the initial coin offering fundraising method. In this context, this study shows an objective overview of potential answers to these questions. The research question is answered through a comparative approach that shows world legal trend on this technology. Analyses of most popular cryptocurrencies technical description reports, official public statements belong to several countries' institutions, legal codes of these countries will be used to evaluate countries' aspects to cryptocurrencies and ICOs and future possible perspectives. On this basis, it is recommended that it is still early to regulate and qualify cryptocurrencies. However, it is possible to make some clear descriptions by early adaptors of this technology. Further research could be undertaken to identify other legal possibilities it would be helpful for such regulatory bodies to bear in mind when regulating cryptocurrencies and ICOs. In this paper, I investigate the

influence of different types of social media, specifically microblogs and discussion forums, on organizational legitimacy. As legitimacy cannot be measured directly, I follow the approach of previous research and use underpricing as an established proxy for legitimacy. Underpricing is measured in context of the novel phenomenon of Initial Coin Offerings (ICOs), an IT-based funding mechanism with potential to disrupt the capital-raising paradigm. I analyze data of 95 ICOs and provide first results indicating that the activity of independent users on discussion forums confers organizational legitimacy. Moreover, I show that discussion forum activity mediates the influence of both strategic Twitter management and ICO oversubscription on organizational legitimacy. Being the first study on the legitimation effects of social media in the context of ICOs, I invite and motivate further research on the topic. Bachelor Thesis from the year 2021 in the subject Business economics - Investment and Finance, grade: 1,7, University of Frankfurt (Main), language: English, abstract: A token offering is a novel mechanism that enables firms to raise funding by issuing tokens to external investors. Tokens are digital assets that are cryptographically secured and based on distributed ledger technology (DLT), whereas blockchain technology is the most prevalent type of DLT. Depending on the type of token issued in a token offering, one can distinguish between initial token offerings (ICOs) and security token offerings (STOs). Utility and currency tokens are issued in ICOs, security tokens are issued in STOs. Both mechanisms differ in their degree of regulation as STOs fall under much stricter securities regulations. Fundraising mechanisms are a prime topic in finance literature as firms require capital to grow, and there is fierce competition for capital. Initial work examining token offerings predominantly provides studies focusing ICOs. However, there is a lack of studies focusing on STOs, with the exception of Lambert et al. (2020). I seek to extend the finance literature by focusing on both ICOs, and STOs. Hence, I provide a comparative analysis of both fundraising mechanisms: ICOs vs. STOs. Initial Coin Offerings (ICOs) are increasingly discussed as a viable option for start-up companies to raise capital for new projects. In an ICO, a company issues a virtual coin, similar to bitcoin, to raise money. Investors purchase coins in expectation that these coins and their underlying value will rise in the future. Described as a hybrid of an initial public offering (IPO) and a crowdfunding campaign, an ICO poses unique opportunities and risks for both entrepreneurs and investors. Entrepreneurs can attract millions in public investment without the legal and financial restrictions associated with an IPO, and investors can directly finance start-ups and receive a substantial return on their investment. Given the recent emergence of this technology, there is limited empirical research about the ICO landscape. Using data from multiple platforms, this paper provides an overview of the ICO landscape such as the number of ICOs that are KYC-compliant and that exclude residents of

the U.S. and China. In addition, the empirical findings suggest that some variables associated with quality, such as the number of bugs in the smart contract, influence ICO success metrics. Furthermore, this paper analyzes the ICO reputation scores across multiple data sources. There is an inconsistent association of reputation with success metrics and a low correlation of ICO reputation across data sources, highlighting the challenges faced by investors in finding reliable information about ICOs. Given this new landscape, this paper provides a number of potential avenues for research into ICOs. In particular, this research underscores the need for reputation systems to facilitate trust, a bedrock of digital economic transactions. Perfect cryptocurrency journal for all things crypto.
