Written by renowned equine dermatologists Danny Scott and Bill Miller, this all-inclusive resource covers the latest dermatologic topics and the newest therapies. Current, comprehensive coverage includes every known equine dermatosis. An emphasis on differential diagnosis includes key differentials and breed predilections for each disease, especially helpful when you have only a specimen and an incomplete history to work with. A consistent format makes it easy to locate information on each skin disorder, including a clinical description, its cause and pathogenesis, clinical features, clinical management, diagnosis, treatment, and any zoonotic aspects. Expert authors Danny W. Scott, DVM, and William H. Miller, Jr., VMD, offer years of knowledge, experience, and their vast image collections. Diagnostic tables in each chapter provide a quick reference for identifying lesions and disorders. An extensive list of references at the end of

Discusses maladies such as delusional parasitosis that are often seen in returning travelers, including those making international adoptions, transplant patients, medical tourists, and more. Busvine's introductory account of the evolutionary histories of insects and mites leads on to a fascinating study of human reactions to ectoparasites. It shows how the extent of man's curiosity about them and references to their prevalence provide a continuous commentary both on the history of biological science from Aristotle to the present day and on the modes and manners of ages past. Subjects of ribald verse, quack medicine and morbid imagination as well as literary symbols of piety, love and human insignificance, this is also the history of how medicine discovered that ectoparasites acted as transmitters for epidemic diseases. Infectious diseases kill more people worldwide than any other single cause. Lippincott's Guide to Infectious Diseases helps you assess, treat, and educate your infectious disease patients---with an emphasis on preventing transmission! Background: Head lice infestation is a

ubiquitous concern in the United States. Head lice are associated with social stigma and are typically managed by home management and social and school exclusion. Pesticides and chemicals are the most widely recommended treatments for head lice. These products used inappropriately have the potential to cause harm to humans and the environment. Anecdotal evidence and research studies indicate that there are inappropriate and unnecessary exposures of young populations and the environment to chemical treatments used to treat lice infestations. There is a gap between the knowledge about head lice and the information that those treating head lice receive and their actions taken to eradicate head lice infestation.

Purpose: The purpose of this grounded theory study is to explore the decision-making process that caregivers use regarding management of head lice for their children.

Method: Qualitative constructive ground theory

Findings: Battling stigma: A grounded theory of the process of combating head lice emerged from the findings that parents described when they were confronted with decision making in the context of a stigmatized condition such as head lice. The process is cyclical and

describes a variety of behaviors and actions that are guided by stigma and misinformation. The cycle repeats because parents learn experientially using misinformation to guide their decisions. The following constructs are included in the process: Perceived Equilibrium, Surprise Attack, Preparing for Battle, Combating, Coping with Aftermath, and Readjusting Sense of Self. Conclusion: The study highlights the actions and consequences that occur when parents react emotionally as opposed to using their everyday cognitive decision-making process for childhood illnesses. The consequences result in financial, health, and environmental harm. The process repeats and perpetuates ongoing stigma and misinformation concerning head lice. Nursing interventions and policy advocacy are necessary to provide a pathway for destigmatization of the condition and for more efficacious treatment with fewer health and environmental impacts. Applying the model to other stigmatized health conditions may give evidence for a much broader usage and utility of the model. It is the position of the National Association of School Nurses that the management of pediculosis (infestation by head lice) should not

disrupt the educational process. No disease is associated with head lice, and in-school transmission is considered to be rare. When transmission occurs, it is generally found among younger-age children with increased head-to-head contact (Frankowski & Bocchini, 2010). Children found with live head lice should remain in class, but be discouraged from close direct head contact with others. The school nurse should contact the parents to discuss treating the child at the conclusion of the school day (Frankowski & Bocchini, 2010). Students with nits only should not be excluded from school, although further monitoring for signs of re-infestation is appropriate. It may be appropriate to screen other children who have had close head-to-head contact with a student with an active infestation, such as household family members, but classroom-wide or school-wide screening is not merited (Andresen & McCarthy, 2009). In cases that involve head lice, as in all school health issues, it is vital that the school nurse prevent stigmatizing and maintain the student's privacy as well as the family's right to confidentiality (Gordon, 2007). The school nurse, as a student advocate and nursing expert, should be included in school

district-community planning, implementation, and evaluation of vector control programs for the school setting. School nurses are also in a pivotal position to dispel myths and stigmas regarding pediculosis by providing education on the life cycle of the louse, methods of transmission, treatment options and care of the environment to the student's family, school and community at large. There have always been homeless people in the United States, but their plight has only recently stirred widespread public reaction and concern. Part of this new recognition stems from the problem's

prevalence: the number of homeless individuals, while hard to pin down exactly, is rising. In light of this, Congress asked the Institute of Medicine to find out whether existing health care programs were ignoring the homeless or delivering care to them inefficiently. This book is the report prepared by a committee of experts who examined these problems through visits to city slums and impoverished rural areas, and through an analysis of papers written by leading scholars in the field.
