"Benson's Microbiological Applications has been the gold standard of microbiology laboratory manuals for over 35 years. This manual has a number of attractive features that resulted in its adoption in universities, colleges, and community colleges for a wide variety of microbiology courses. These features include user-friendly diagrams that students can easily follow, clear instructions, and an excellent array of reliable exercises suitable for beginning or advanced microbiology courses. In revising the lab manual for the fourteenth edition, we have tried to maintain the proven strengths of the manual and further enhance it. We have updated the introductory material in many exercises to reflect changes in scientific information and increase relevancy for students. Critical thinking questions have also been added to increase the Bloom's level of the laboratory reports. Finally, the names and biosafety levels of microorganisms used in the manual are consistent with those used by the American Type Culture Collection. This is important for those users who rely on the ATCC for a source of cultures. Guided Tour Through a Lab Exercise Learning Outcomes Each exercise opens with Learning Outcomes, which list what a student should be able to do after completing the exercise. Introduction The introduction describes the subject of the exercise or the ideas that will be investigated. It includes all of the information needed

to perform the laboratory exercise. The fourteenth edition has improved its student relevancy message within these introductions, explaining to students why they should care about the lab"-- A lab manual to be used in the Santa Rosa Junior College Microbiology 5 class. Description: Course covers the morphology, growth, metabolism, genetics and control of microorganisms, with emphasis on bacteria and viruses. The single most comprehensive resource for environmental microbiology Environmental microbiology, the study of the roles that microbes play in all planetary environments, is one of the most important areas of scientific research. The Manual of Environmental Microbiology, Fourth Edition, provides comprehensive coverage of this critical and growing field. Thoroughly updated and revised, the Manual is the definitive reference for information on microbes in air, water, and soil and their impact on human health and welfare. Written in accessible, clear prose, the manual covers four broad areas: general methodologies, environmental public health microbiology, microbial ecology, and biodegradation and biotransformation. This wealth of information is divided into 18 sections each containing chapters written by acknowledged topical experts from the international community. Specifically, this new edition of the Manual Contains completely new sections covering microbial risk assessment, quality control, and microbial source tracking Incorporates a summary of the latest methodologies used to study microorganisms in various environments Synthesizes the latest information on the assessment of microbial presence and microbial activity in natural and artificial environments The Manual of Environmental Microbiology is an essential reference for environmental microbiologists, microbial ecologists, and environmental engineers, as well as those interested in human diseases, water and

wastewater treatment, and biotechnology. Excerpt from Laboratory Manual in General Microbiology Since the first appearance of this Manual in 1915, there have occurred some developments of fundamental importance in our conceptions of microbiological technic and laboratory procedure, as a consequence of which a revision of the text has become almost obligatory. Nearly all of our associates in the laboratory were connected with some branch of the Medical Corps during the War, and in their various capacities gained new viewpoints of certain phases of microbiological laboratory operations. Constant use of the Manual in our own laboratory and suggestions from a great number of sources, kindly furnished by teachers and even laboratory workers in various parts of the country, have induced us to attempt a revision with numerous corrections and many additions. The use of Fuller's Scale has been abandoned; the use of the autoclav rather than flowing steam in sterilization is recommended; the more recent views regarding reaction of media involving the determination of pH have been given consideration; the sections dealing with soil and water and sewage bacteriology have been almost completely rewritten; important alterations and additions have been made to the section on pathogenic bacteriology; vital additions have been made to the Appendix. It has been thought advisable to include in the pages preceding the first exercise a list of apparatus required by each student, also an outline or schedule for the use of the Manual in the beginning classes. Extensive changes in references have been made. New literature and new editions of texts demand that the instructor keep in touch himself and put his students in touch with the changes.
